Well done Sir, a nice piece of homebrewing. Indian hams have
traditionally held the task of keeping the old arts alive, the "using
what you can get" attitude, the scrounging, the recycling,  the
grinding of xtals with toothpaste because new ones? - forget it! -
building and testing with minimal tools and equipment, and producing
some nice radios. Now a Days, its called being "Green" <g>
I note that was in 1983 - synthesizer/dds stuff is now getting to the
recycled stage, even in very cheap domestic stuff - have you updated
the design, can you show us some more of your homebrew gear. Its nice.

73 de VK3BFA Andrew.

For boatanchor stuff......................
On your list of places to buy and sell, for those who are not already on
it,
there is baswaplist@muchstuff.com.
baswaplist has existed about 12 years. In the beginning it was
baswaplist@foothill.net.
It exists only for buy, sell and swap.
It has always required prices for items offered for sale; unless it is
clearly not possible to come up with a market value.
This is a no BS list. No discussions, death notices. tornado warnings,
and
most despised, is an apology, particularly an apology for a message that

Howdy all,

I picked up a Heathkit Jr workshop 35 at an estate sale and would
like to find out how to operate it. It has 3 spring connections labled
SP3, Com and K3.

I have hooked up a 9V battery...+ to the SP3 and - to the com. what do
I hook up to K3? and am I supposed to get a tone?

Thanks in advance!

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

OK Hopping back on topic.   I recall that there are stiff materials - like steel compared to aluminum,and stiff structures - like an aluminum tube compared with a steel strip of the same weight per length.

In the same way, you have brought up negative resistance structures of several designs, and I thought you were going to mention objects that have a naturally -ve resistance region. And you did at one point.

I recall seeing on the net, some mention of an experimenter who scorched some galvanized sheet and found that a point contract placed on it could resonate a tuned circuit with its negative resistance.

Gotta love those folks.

Hey OM:

I remember way back when we used to take blue steel double edge razor
blades and make a point contact negative resistance diode from them, a
good ground, and mother oats box wrapped with wire and a long wire
antenna, wow

FWIW, one well-known negative dynamic resistance element is (the input
side of) a switching power supply. If the supply maintains a nearly
constant efficiency with changing input voltage, and the output
supplies a constant-power load, then the input power is nearly
constant with changing input voltage: the current drops as the
voltage rises. Beware a few million personal computers on a power
grid: avoid letting them excite a resonance in the grid...

(Slightly off-topic: a Google search reveals that the power community
is indeed interested in grid resonances. See "Schumann Resonance,"
for example.)

Cheers,
Tom

Others that a search of your document didn't find:
--Tunnel diode
--Back diode
--Unijunction transistor
--Gas discharges (e.g., neon light bulbs and even arcs in air)

Historical note: the negative resistance of an arc was used to excite an LC resonator in _arc_ (as opposed to spark) transmitters from a century or so ago. I'm often amazed at what early radio engineers were able to accomplish...

I guess there was a hint (at least, maybe more) in the text about trigger diodes, commonly used to trigger SCRs and triacs.

Tom

There is nothing wrong with microprocessor crystals, they are often made to good tolerances, often 10ppm or better. There are only a few common frequencies (not surprising many are a power of two, or a multiple thereof), and the crystals are manufactured in huge numbers so they are cheap (often around 50 cents each or less in small lots). Many hams have built good IF ladder filters out of these rocks. You do have to buy a few of them to find a matched set for the filter, but the total cost will be a fraction of what a new filter would cost. Another thing about these crystals is that they are often found in very small SMT packages. I'm not sure that the smallest sizes work well in a ladder filter though. The same goes for the 'tuning fork' version that uses laser timed metal elements with a very small amount of quartz (I've heard that high quality quartz is getting scarce and crystal makers are looking at ways to use less).

Hi All,

I am developing a small, low power SDR from the ground up, planned
phases include:

a) hardware development DSP and RF up-convertor
b) algorithm development FM encode and decode
c) algorithm development SSB encode and decode
d) hardware development RX down-convertor, and IF gain, with AGC
e) hardware development RX front-end
f) hardware development TX amplifier

g) hardware development LO generation (initially a signal generator)

Phases a) and b) are complete and working to my satisfaction, phase c) is a couple of days away from completion, so it's time to start thinking about d)

The IF is base-band (DC to 5kHz) I+Q, and the DSP on board ADC is capable of 10 bit resolution. I am planning to move to a 16 or 20 bit consumer audio codec in due course. Assume a 2V ADC reference in each case, so an LSB change for a 10 bit system will be around 2mV while and LSB change for a 16 bit system will be around 30uV.

The down-convertor is an RF2703 which has 24dB gain and 24dB noise figure in the planned configuration.

My question really revolves around noise figure and gain for the IF and RF front ends for use with 10 and 16 bit ADCs, and for use at 14MHz and 144MHz, also options where to put the AGC.

First issue really is 'what is appropriate performance' for the front ends ? At 144Mhz, -122dBm for 12dB SINAD seems like an appropriate number (is it ?). What should I be attempting for 14MHz ?- this band is much noisier.

Second issue is about gain and noise figure for the RF and IF stages - any thoughts on how to calculate these figures will be most appreciated.

Finally AGC - where, how, options, pros and cons.

If these aren't the correct questions for me to be asking, then what are the correct questions ?

Thoughts, pointers and help all appreciated.

Many thanks, Mark

I'm designing an IF filter for a receiver that's placed at the output of a passive (diode-type) mixer. While the mixer's RF input is being fed with a (nominally) 50ohm source, is it correct to think that "looking" back into the IF port the filter is going to "see" a 50ohm impedance as well? (Normally I'd have a buffer stage right after the mixer to re-establish impedance levels, but in this case I'm trying to keep things low-power and hence directly feed the mixer's output into the filter.)

Thanks,
---Joel

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may

still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

Yes,but only if the other two ports are closed with 50 ohm...

Happy new year,

P.S: Beware of filters, they are highly reactive outside their
      resonant frequency, so (they) reflect back signals with
      worsening behaviour of mixer (spurs).

Put a diplexor between the output of the mixer and the filter. Use a
matching transformer between the filter and the mixer so the mixer will
see a 50 ohm impedance. In my case I assumed the filter had an
impedance of about 500 ohms so I am going to use a 1:9 (1:3 turns ratio)
between the mixer and the filter. This transformer will be a trifiler
wound toroid and will be wired as an autotransformer. (the three
windings in series connect to the filter and ground, a tap on the first
winding up from ground will go to the mixer). The diplexor consistes of

a series resonant circuit between the mixer and the filter. In parallel
with this series resonant circuit are two 51 ohm resistors in series
with a parallel resonant circuit between the two resistors and ground.
Select the L&C to resonant at the IF frequency with a Q of 1.

Normally the LO port is driven hard enough that one pair or the other
of the diodes looks like a low resistance almost all the time. Thus
the source impedance feeding the RF port is echoed, plus a little, to
the IF port, assuming 1:1 transformers in the mixer. As I recall, I
measured something close to 60 ohms for one MiniCircuits mixer
(probably a +7dBm type), under conditions I don't recall now other
than that they were nominally as you're describing. As Ken Scharf
says, it's good to use a diplexer to maintain a constant load at all
frequencies.

Cheers,
Tom

Thanks guys, I appreciate all the help.

The filter is a bandpass filter (the IF is 45MHz), though, so don't I really
need a triplexor if I really want to wideband terminate the mixer "nicely?"

(Low-, band-, and high-pass outputs.) Although my understanding is that
"triplexor" in this context can consist of a single inductor for the low-pass
port and a single capacitor for the high-pass port, which certainly is quite
doable.

?? So, "triplexor" to me means something with three bands, which you obviously won't do with just a high pass and a low pass. In any event, the goal is to keep a reasonably constant load on the mixer at all frequencies where it may have significant output. The distortion generated by a mixer depends on the load it sees.

If you go straight into a crystal filter from the mixer, it can be problematic to get a constant load impedance, since the impedance looking into the filter changes so rapidly in the sharp transition between passband and stopband. For example, if your passband is 44.99 to 45.01 and the mixer output has strong signals at 44.96 and 44.98, how can you, with a practical LC circuit, make sure those signals are terminated in an impedance which maintains low distortion, while still passing the signals in that range to the sharp filter? Note that 3rd order intermod between those two out-of-band signals I suggested lands right in the middle of the crystal filter bandpass. That's why you want to be sure to terminate the mixer in an impedance that doesn't lead to excessive distortion (in particular, distortion products that can land in the passband of the crystal filter). I think a reasonable answer is to learn what range of termination impedance causes problems, and what range is OK. For example, it may be bad if the mixer is terminated in an "open", but of relatively little consequence if it's terminated in a "short." That gives you a handle on how to achieve the lowest practical distortion--which is generally the whole point of controlling the load impedance seen by the mixer over a wide frequency range.

Cheers,
Tom

What I meant was... output of mixer to parallel connectors of (1) the crystal filter (bandpass) , (2) series inductor/resistor (low-pass), and (3) series capacitor/resistor (high-pass), hence, a triplexor.

But I realize now that a duplexor is just as viable, consisting of a parallel connection of (1) the crystal filter (bandpass) and (2) a parallel LC resonsator in series with a resistor (bandstop).

Yeah, I see what you mean. I should do some actual measurements to see just how much improvement is possible with a proper wideband termination...

Thanks for the help!

Well, as the second paragraph of my previous posting hints, a 50 ohm
termination at all frequencies may actually not be optimal. There's
no law of physics, as far as I know, that says the mixer's lowest
distortion (especially distortion products that fall in the following
filter's passband) happens when it's loaded by 50 ohms. If you set up
to make some measurements, you may find that you actually get lower
distortion at some other load impedance. Perhaps optimal for the
mixer's performance would be a 50 ohm load in the filter passband, to
maximize signal output, and, say, a short at all other frequencies.
I'm not saying it IS that way for any given mixer, and perhaps not for
ANY mixer, but it's a question worth pondering if you're looking for
the best possible distortion performance.

But then you'll find the next problem: the input impedance of the
crystal filter will change dramatically, very quickly, in the region
of its passband -- and likely will be capacitive on one side of the
passband and inductive on the other side. Assuming it's a reflective
design with low internal dissipation, by definition it must reflect
out-of-band energy (and pass in-band energy to the load at the other
end of the filter). Given that situation, how do you design a circuit
that will maintain the load impedance you want for your mixer, for
frequencies a little below the filter passband, in the filter
passband, and a little above the filter passband? If you try to do it
with inductors and capacitors, where do you get parts with high enough
Q to allow the required extremely rapid change of impedance near the
filter's center frequency? Or do you just accept that the distortion
won't be optimized? Or do you throw away some of the signal and put
in a bit of attenuation (a 50 ohm pad) between mixer and filter? Or
do you go looking for the "Holy Grail": a buffer amplifier that runs
on low power and offers good input and output return loss, a third

order intercept that doesn't degrade further what the mixer has already done, and a good enough noise figure? The buffer amplifier can solve the matching problems (at least if you're happy with a constant load, e.g. 50 ohms, on the mixer), but it's not trivial to find an amplifier that will do what you need without introducing problems worse than the cure.

As you think about all this stuff, it becomes easy to see why nobody has yet built the perfect receiver. ;-)

Cheers,
Tom

Hey, I was at a conference some five years or so ago now where some high-level
muckety-muck from Intel got up there and claimed that within a few years we're
be connecting antennas straight to ADCs and radios would henceforth be 100%
digital... :-)

Of course, it is a bit easier to build a good radio when you're operating in,
e.g., the cell phone bands and by law you control the spectrum (no big
intereferes), you manage the power of all the transmitters dynamically
(limited self-interference), etc.!

No, that just means the potential is there for "the perfect receiver".
Even if the hardware is "perfect", the software still has to be written.

Like that classic FM broadcast receiver in the old GE Transistor Manual.
A tunnel diode acting as an oscillator and mixer, it drops to an IF about
200KHz, where there is a pulse counting detector. It works because one
can live with the image frequencies, and one knows where all the wanted
signals will be.

Well, I guess it was about four years ago now we introduced a 100kHz
to ~35MHz receiver that practically does that. There are gain stages,
attenuators and some selectable filtering in front of the ADC, but our
customers want to be able to "listen" to the whole band at once, so
you can switch the filtering all out if you want. I did most of the
hardware, up to the signal processing. We've gotten feedback from
some customers that it's the best receiver (for that purpose) that
they can buy. It's particularly spur/residual-free: I added some
copper tape to one to see just how good I could make it, and the worst
residual is about -144dBm at the switching frequency of one of the
switching POL regulators (around 600kHz). Worst residual above 1MHz
is about -154dBm. I think it's fair to say that's pretty hard to do
with a general-coverage superhet design. But neither the hardware nor
the software that goes with it are inexpensive enough to worry that
it's going to replace other ways to do it any time soon--and the
performance doesn't quite equal what you can do with a really good
single-signal superhet design. Check in again in a few years,
assuming that there's enough economic incentive for ADC designers to

give us a little bit better parts. There are some claims out there for really stellar ADC performance with Josephson junctions, but they require cryogenics, and from what I've heard not all the claims are substantiated...

By the way, the gain that's available in front of the ADC in this design is mostly there because customers expect to need the gain, based on previous experience. In a perfect world where they really understood what's needed, I could have gotten by with maybe 10dB maximum available voltage gain between the antenna and the ADC. I'm more worried about how to gracefully handle big signals--much more worried. What do you do about the plethora of short wave broadcast signals, several of which can each be up to perhaps 0dBm out of your antenna, or the fellow just down the street (or on the same ship, etc.) who keys up a transmitter and feeds +20dBm to your receiver -- WHILE you want to keep listening to the signal that's only -110dBm at your receiver?

Cheers,
Tom

Hi Joel. In my experiance with diode ring mixers they almost always require specific impeadance terminations on all ports. The input should look at 50 ohms, the L.O the same. The I.F port is the most important to terminate properly if the desired switching or mixing products are to be produced. In many receivers designed for high dynamic range the I.F of the diode ring is terminated into the base circuit of a very strong bipolor transistor stage using feedback many times. Because of the feedback used and particular biasing this stage can be designed tolook like near 50 ohms to the I.F port of the diode ring. This is not enough many times though. This same transistor amp stage then many times drives a crytal I.F filter that can have the correct 50 ohm term if designed that way but this term will only be 50 ohms very near the passband of the filter and frequencies that depart from this 50 ohm passband away from this freq causing this hi SWR to reflect the incorect impeadance back through the output to input of the amp missmatching the diode ring. Amp.s that use heavy feedback are even worse in this respect. In cases like this the designer many times hooks a 50 ohm pad (such as 6 db) to force a decent 50 ohm load back through the amp to the mixer. This mixer termination stuff is quite important if the mixer is to work as it should.In situations where lower dynamic range is desired for battery drain, etc, this termination MUST be provided for in other ways. The same thing holds true for direct conversion or zero I.F receive schemes, the audio preamp is biased and designed for a 50 ohm term for the diode ring. Much can be learned in literature such about this topic from Solidstate Design for the Radio Amateur, Experimental Methods in Radio Design, both by coauthor Wes Hayward, W7ZOI and much can be learned from publications by Minicircuit Lab's, the builders of many high quality DBM's for industry. Check the web, much can be learned. 73's, Doug,

At work one of the products we sell to the military consists of a handful of electronically adjustable notch filters for precisely this purpose -- the output is fed to (someone else's) SDR.

...although our dynamic range isn't the 130dB+ that you'd need for your later example... (at least in some reasonable bandwidth...)

Your almost-all-digital HF receiver there sounds quite impressive. Do you give the user the option to adjust the switcher's frequency away from 600kHz if they happen to really want the best sensitivity right there? (...this seems to be the common approach with many a ham HF rig...)

Hi Joel,

I'm curious about the tunable notch filters.  Is there a data sheet I
can find somewhere?

There's really no need to get the ~600kHz any lower.  Any decent
antenna at that frequency will pick up way more atmospheric noise than
the level of the switcher residual.  After all, -144dBm is only about
14 nanovolts RMS at 50 ohms.  I think it's fair to say that any of our
customers looking for little signals will be using good antennas for
the job.  Admittedly, a stock unit won't do that good, but it will be
in the neighborhood.  Of course, the high noise level at ~1MHz is why
we get by with such crumby antennas for our portable and car AM
radios.

Cheers,
Tom

Front end band pass filters are really kind-a mandatory on any SDR as
people in high RF environments will simply have IM and a/d converter
overload. If you use AGC, the 100KW broadcaster or passing 500w aircraft
radio will close and reduce headroom diminishing weak signal sensitive in

the desired band.

Most all the good SDRs I've seen have several fixed freq band pass filters designed around common high power bands. But, what would rock would be a wide band (1Mhz or so) variable band pass filter with steep slopes on the front end before the first nonlinear device that could be center freq shifted. This would-could reduce the parts count and cost since you would only need one filter and a D/A converter to S/W control the shift.

Another idea would be a log amp on the front end to reduce the dynamic gain of signals over a certain voltage without changing the gain too much of weak signals. The signal could be inverse logged after the A/D. The down side is a non-linear signal feeding the converter which will hurt EbNo of digital signals.

Is there any software still being maintained for running a CW beacon-
like TX in command line Linux?

I am looking for something that could use a serial or parallel port to
send any specified text file, which would make it capable of sending
dynamically generated content (acquired or mailed-in and written to
text).

I saw
- cwbeacon, which seems self-contained, scriptable (in the above
sense), but  extremely old, unsupported, not included in any current
repository;
- cwdaemon for UDP to port keying, where UDP might  either simplify
things OR be an unnecessary passage;
- unixcw, which is alleged to port-key as an "option" - but I can't
see it..

Is this all? Is there a howto I missed? Is such CLI capability hidden
into any GUI app - e.g. as in the vlc-nox  player?

tnx es 73 de n1jpr

Hi,
I need help with this mixer on picture. Is it normal that after BF981 IF amplitude is lower then input signal in mixer (70MHz)? Would not this kind of mixer have some small gain? For XTAL I use 20MHz crystal instead of 60MHz (because I can't find 60MHz crstal) , I have oscilation of 60 MHz on G2, but I'm not sure is it ok to use 20MHz instead of 60MHz..

Thanks in advance,

Hi,

A spot of blatant advertising, and we'll not trouble you again for another few years, but we thought that we would give the amateur radio usenet community an opportunity to benefit, as we have over the years from using usenet groups. Many of our existing customers are also radio amateurs and many have of them an active interest in DSP.

ONEoverT Digital Filter Designer is used by them in the design and test of many DSP projects requiring filters including software defined radio, satellite receivers, telemetry modules etc.

For the month of January, we are making a one-time offer where we have reduced the price of full version of ONEoverT Digital Filter Designer by 90%. The last time we did this was eight years ago. From it's normal cost of 300 GBP, it is now only 30 GBP.

http://www.tyder.com

You will be able to design :

FIR filters (windowed and optimal) up to 8192 order
IIR filters. Butterworth, Chebyshev (Type I and II) and Elliptic
Root and Raised cosine filters up to 8192 order
Halfband filters up to 8192 order
Differentiators up to 8192 order
Hilbert Transformers up to 8192 order

You can also use the FFT facility to carry out frequency analysis of signal files.

You also have the ability to link with our VHDL module which you can
use to
generate all the above filter designs for FPGA or ASIC. Although this
is not part of the
offer at this time, we will look at each request on a case by case
basis and offer any cusyomer a great deal.

Best Regards
Bob Carter

Since you can't anyway, that statement is an attempt to show your

They do this to try to keep the self-resonance of the winding up above
the operating frequency. By spreading the winding out into series
connected pancakes the stray capacitances have a harder time shunting
large inductances. You see this kind of construction on RF chokes too.

Tranformers from the 1960's vintage for bipolar transistors were
tapped in strange ways. I don't remember any special use of taps
on tube era stuff.

There's a discussion older ARRL handbooks about getting broad bandwidth
with dual tuned over-coupled IF transformers.

Digging out an copy of Terman's _Radio Engineer's Handbook_ (that I
bought at a used bookstore and never got around to reading), it has
a discussion of point 3 in the section on "tuned amplifiers", (which
appears to be what the ARRL was cribbing from).

Ah, clever!

One I was looking at the other day has some fancy weaving involved as well; it
must have been quite an interesting machine that made them.

Poking around You Tube some I see that winding single-layer (no fancy waving)
coils is quite doable at home (the Tesla coil guys are quite into it). It's
pretty slick: http://www.youtube.com/watch?v=N3N-tw6OEXw .

Thanks for the help,

Thanks John.

What stymies me about the double-tuned transformer is this: If you look at Hagen's exaplanation for how they can be modeled -- I've stuck a scan here: http://koltner.com/Hagen.png -- he's modeling it as the primary's parallel capacitor is resonating with the magnetizing inductance of the IFT and the secondary's parallel capacitor is resonating with the leakage inductance... and this is then made more obvious if you use the high-Q approximation and transform a parallel RC circuit into a series RC circuit. But if that's the case... doesn't it seem as though the most straightforward way to use an IFT would be to have a parallel capacitor on the primary and a *series* capacitor on the secondary?

I realize that you can move impedances from one side of an IFT to another and change the equivalent circuit model and so on and present numerous different "views" that all end up with the same correct mathematical behavior to model what are really just two coupled inductors, but still... does anyone using a series resonating capacitor on their secondaries?

Answering myself here:

"Joel Koltner" <zapwireDASHgroups@yahoo.com> wrote in message news:VCS9p.725707$iV7.263632@en-nntp-15.dc1.easynews.com...

> does anyone using a series resonating capacitor on their secondaries?

Googol books provides some pages from the "Electromagnetic Compatibility Handbook" by Kenneth Kaiser (http://books.google.com/books?id=nZzOAsroBIEC&pg=RA1-PA19&lpg=RA1-PA19) and states:

"There are four different configurations for the double-tuned transformer based on the positions of the capacitors on the primary and secondary sides.

For example, one capacitor can be in series with the primary winding, whereas another capacitor can be in parallel with the secondary winding. A few reasons why one configuration is selected over another will be discussed after a few circuits are analyzed."

...and so on...

This is Good To Know.

If you use a capacitor in series with the winding to create series resonant circuit, then the impedance at resonance will be low.

For a tube IF, you really want high impedances at resonance.

In the plate circuit this is to minimise current draw.

The grid input of the preceeding stage is high impedance and is voltage driven, therefore a parallel tuned circuit is ideal.

So hence the use of dual parallel tuned circuits.

I should have added

If you want to see an application for series tuned curcuits, although not in
a IF application, have a look at the base circuit of almost any VHF
single ended RF power amplifier using a bipolar transistor. The input
impedance of such amps is low hence the appropriate use of a series tuned
circuit.

Hi,

I recently re-found a homebrew receiver that I built back in the 80s and am going to try to get it going again.

My question is regarding the Kokusai MF-455ZU-21H mechanical filter. This was a popular filter in its day and I wonder how well they hold up over time? I know some of these things had foam that melts/disintegrates into mush. Any comments or observation on this particular type would be appreciated.

Thanks,
Bill WX4A/KP4

I had one in my KW2000A. It lost sensitivity and drive due to filter degrading. I unsoldered the can and removed the goo that the foam had become, much improving performance but it's still well below par. The transducers or transformers at the ends of the filter are easily damaged and also likely to fail. Somewhere on the internet are details for refurb. There was also an article years ago on upgrading to a crystal filter but I can no longer find it. I've now given up on that rig and gone to an SDR one.

Thanks Brian. I was afraid of that. I never had the radio up to 100%
originally. It was a homebrew and I guess its like a new project
nowadays with all the pieces there to troubleshoot. Its not a
'necessary' rig but I'd sure like to get it in shape for old times
sake...if I can. It was a learning experience before - some things
don't change, do they?

Regards,
Bill

I don't know which filters had the foam problem, all I remember hearing about is "Japanese mechanical filters".

But they have been discussed before, I think here but maybe in the boatanchors newsgroup. I can almost picture someone detailing how to renovate them. I just tried <"mechanical filter" foam> and that gets some relevant hits, but apparently aquariums use "mechanical filters" so there must be some word that would limit it to radio. One post had a link to a webpage, but the webpage is no longer there, so doing a more careful search of the mewsgroup archives and then a websearch might help.

Googling "Pi-wound coil" may help. It was to reduce shunt capacitance,
as mentioned.

Are you talking transistor IF transformers, with one slug each, or tube-type, with two? Two-slug IF transformers, with lightly coupled and independently tuned coils, gave you two filter sections in one can.

Old radio texts. If you still get up to Portland from time to time, dig through Powell's Technical books.

What are you trying to do? There's good reason for not wanting to have a circuit with a bazillion tweaks that all have to be right for the thing to be in tune.

One slug each. I hadn't remembered two two-slug types, but now that I think about it, I think I have seen them.

Good idea, will do.

Yeah, although it's kinda a sad commentary that many an "FM receiver" today doesn't have a tuned front end and, as such, actually performs rather wose than radios from 30 years ago now, you know?

As for what I'm trying to do... mostly just fully understand how the cheap little transistor radios they made up until a decade or so ago operated; I sure couldn't have designed one at the point I graduated from college, and these days I finally feel as though I'd have a decent shot at it. (On the other hand, I did feel I could have designed a 6502 when I graduated from college, and then some fancier superscalar processor by the time I finished grad school -- so it's not like I didn't get anything out of it.)

(On the other hand, I *have* designed various radio transmitters and receivers that work well, they were just done more at the MMIC/IC/MiniCircuits-parts level rather than the "discrete transistor/coupled coil" level -- you know, the kind of designs industry will actually *pay* you to do. :-) You probably don't do many PID loops with op-amps anymore I expect?)

Thanks for the help,
---Joel

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Hey OT;

I built this thing back in 1969 when I used to make a living selling
6AG7's
'Cept my osc used a bipolar and the output I had an antenna tuner with
parts from a Multi-Elmac. Oh yeah I used a 8"x11" piece of masonite
with fahnstock clips to connect everything, I carried it in a
looseleaf binder, was the sweetest QRP rig I ever built. Tanks for the
memories.

Looking for any information on an Illumitronx Pi network "PI air dux" , part
number 1212D6 like power ratings, recommended taps / tube, etc. Looks like
#12 silver plated wire.
Not sure of the spelling but it looks to be Illumitronx. Google turned up
nothing.

Would it be a correct assumption that the vari-pitch Air-Dix coils were used with whatever-the-then-common variable capacitor was to achieve linear tuning (...I realize that over time capacitors were purposely made to have non-linear capacitnace with respect to dial position to achieve this as well...)? Or something else?

I like the 1957 prices. :-)

Does Mouser still sell them?

The point of the IF transformer was twofold: to provide selectivity, and to give a good impedance match between stages. I think there must have been a standard receiver design, as there just seemed to be one choice for each coil -- this in spite of the fact that as soon as you start juggling feedback and/or standing currents, you change the impedances, and therefor the required transformer.

I think if I were going to design a broadcast-band receiver, I wouldn't just re-do the old schematic from 1960 -- I'd start from a clean sheet of paper, and see where I could go from there. (Actually, I think the first thing that'd go onto that clean sheet of paper would be an ADC -- I'm a luddite in a lot of ways, but not in how I'd like to see a receiver laid out).

Somewhat surprisingly, yes, they do. (Although of the many hundreds they have listed in their system, it's only something like a couple dozen they actually have stock of.)

Agreed -- and I additionally suspect that many people who made those receivers didn't necessarily understand the design itself that well. I.e., if it basically worked and wasn't clearly deaf, it became a product -- few if any AM/FM receivers found on the shelves of, e.g., Sears listed things like their sensitivity, adjacent channel rejection, etc. (From the flip side, though, I suppose that's one of the things the FCC did: Coordinated frequencies and power levels such that just about any radio would work "reasonably" well; it's a very different market from, say, amateur radio where there's little or no coordination of these parameters and the customer may very well want to try to listen to some QRP station on 14.15MHz while there's some big gun blasting away on 14.14MHz...)

I agree insofar as the actual design goes, but I like to study these older technologies because I think it's all too easy to not realize just how good the performance of some of the old designs were (for your new design you'd like to start with specs that are hopefully some improvement or at least as good as the old ones...), and also because a lot of the same *techniques* can be applied to modern designs just as well as they could to old ones (e.g., varactor tuning is just an evolution of mechanical tuning, neutralization applies just as much to BJTs as it does to tubes, etc.).

That works, but consider that if you digitize the entire broadcast FM band at once (all 20MHz of it), compared to a $20 superhet receiver:

-- Your weak signal sensitivity may be worse, since your dynamic range is spread across the entire band rather than just what'll fit through an IF filter.
-- You'll likely suck rather more power from a battery.
-- It'll probably cost more.
-- For the channels you can receive well, you'll have infinitely more options on being able to reduce noise, change your audio bandwidth, recovery stereo, decode RDS, an so on. :-)

No, since the inductance, however it's achieved (that is, whether the coil is one constant pitch or multiple pitches or continuously variable pitch), is constant for a given switch setting. The reason for the "variable" pitch in a tapped PI network coil is so that the lower inductances for the higher frequencies don't end up being coils that are very short compared with their diameter. A good way to put it is perhaps that the unloaded coil Q is more constant over the various bands, if you use a larger pitch (wider spacing) for the coil section that will remain unshorted on the higher frequency bands.

Cheers,
Tom

Ah, thanks Tom! That makes a lot of sense.

There were scans on alt.binaries.pictures.radio, I think it was, from the WWII era where Admiral Radio had these futuristic drawings of what the radio and TV of tomorrow would look like, assuring you that's what they'd be bringing you once the war was over and their factories could be put back to such uses: The picture shows a projection screen that looks to be all of 25" or so along with a projector in the center of the couch that's the size of a large dog. So they did have the right idea, just the wrong sense of scale. :-)

In fact, they did: if you pay attention to the analog TV channels and the radio channels in any one market, you'll find that they're spaced apart by at least one 'dead' channel, while those 'dead' channels are 'live' in adjoining broadcast areas.

For instance, in Portland, Oregon the TV channels were 2, 6, 8, 10 and 12, while Salem got the odd-numbers.

> it's a very different market from, say, amateur radio where there's little or no coordination of these parameters and the customer may very well want to try to listen to some QRP station on 14.15MHz while there's some big gun blasting away on 14.14MHz...)

A different problem, too: broadcast implies a few transmitters and lots of receivers, so you hold down system costs by skewing the requirements very heavily toward cheap receivers, even at the cost of efficient bandwidth usage.

Contrast that with pre-broadcast satellite TV, where you save some bucks in the satellites, at the cost of needing big dishes and sensitive receivers. That's OK, because the dishes are few (before they started getting into the hands of the consumers). Then look at the direct-to-consumer satellite systems, where the dish is just two feet across, and you have to assume that the satellite is way more expensive.

True, but you need to know where the old techniques aren't going to serve
you well (e.g. the passives involved in neutralizing a transistor stage
to get a few more dB gain cost more than another stage).

Good point. But getting things through an IF filter, _then_ going into
an ADC isn't a bad thing, unless you're trying for the absolute minimum
of power and circuit cost.

Back as far as the 70's hand operated machines could be purchase for
winding coils. I think I remember seeing them in my old Allied
Electronics catalog.

It is a 1000 watt coil, that's rated in input power by the way, back
in those days they went by input power, I got's an AirDux coil I
bought on ebay it was mounted on a lucite board that went thru the
middle length wise of the coil, had the 10 meter flat wire coil on the
one end the ten meter coil is rated 1000 watts the ten meter coil was
mounted in a plane 90 degrees from the main coil.

Like if the main coil was north south the ten meter coil was going east west
The main coil is 12 AWG silver plated wire the spec. sheet that came with it stated that it was used for 1000 watt input power finals.

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

It depends on the shift, but at the 170 Hz standard it is about 300 Hz
and the amateur standard 45.45 baud at 170 hz is about 250 Hz.

The bandwidth will depend on what shift is being used. Some of the more common shifts are 170,425, and 850 Hz.

The actual bandwidth needed to receive them will be slightly larger. Something like 200 for the 170 Hz shift and 1200 for the 850 Hz shift. The transmitted bandwidth will be larger yet.

It is similar to an FM signal, it theory it is infinite,but in practice it can be much less.

Consider also the group delay of receiving filter...
with narrow Butterworth or Chebyshev crystal filters, group delay is big,
distorting
RTTY , CW or other digital signals, and ultimate result is error in

decoding.

So bandwidth need to be more than necessary. A Gaussian filter is better for
group delay,
but is worse for steepness.

I figured the original question was the bandwidth the signal took, rather than the bandwidth of the receiver.

I didn't think anyone went for a receiver filter to match the RTTY signal. Well maybe the hardcore RTTYers. But generally one used a reasonable filter in the receiver, and counted on the audio filters in the demodulator. There again, relative few decoded at the IF, but even then the articles I've seen didn't go for any special narrow filters for RTTY.

I'm building a 2 metre Rx with an IF of 10.7 MHz. It will be used for FM. I have three crystal filters with the following bandwidths: 15 KHz; +/- 6 KHz and +/- 3.75 KHz. Which one should I use?
Thanks. Howard.

I know that I can connect a *suitable* P/S set to an appropriate voltage
to "float" my batteries *if that is all I want to do* (my little Astron
"switcher" is doing it right now), but I was hoping to get or build
something that will handle the initial phases of charging a
significantly discharged battery then switch automatically to "float" mode.

The thing about a low-Rds-on MOSFET, or a low-Vce-sat PNP, is that it really only gains you a benefit under one circumstance: when it's "hard on", acting as much as possible like a short-circuit. This will happen only during the "bulk" fast-charge stage... and only if the charge controller "sees" that the raw (unregulated) power supply circuit isn't capable of pushing more amps into the battery than the design allows.

If the charge control circuit finds it necessary to reduce _either_ the charge amperage, or the voltage being delivered to the battery, in order to charge the battery safely, then the pass transistor will be "partially off". There will be a significant voltage across it (roughly speaking, Vsupply - Vbattery) and lots of amperage, and so it will be dissipating a lot of energy as heat.

At that point, the actual Rds-on of a MOSFET, or the Vce-sat of a PNP, will matter not at all. You'll have to dissipate (Vsupply-Vbat)*Icharge watts of heat in the transistor.

Now, if you happen to have been careful (or lucky) enough in the design of your "raw" power supply, things will look good. By "careful or lucky", I mean that you've put together a raw supply which just happens to run out of "oomph" at exactly the right moment... the effort of delivering 25A into the battery just happens to cause the supply to sag down to the right voltage (equal to a voltage in the range you want to be charging at). Under those conditions, the whole system will be running "flat out", the pass transistor will be turned on as hard as it can be, and heat dissipation in the transistor will be minimized by using a low-voltage-drop transistor of some sort.

However, this approach has pitfalls... it will be finicky to get right (component selection will be difficult) and it will probably be very sensitive to variations in the AC power-line voltage. In real life, you'd find that much of the time, either you aren't getting the full 25A of charge current (line voltage too low), or the voltage and/or current are potentially too high and the charger is having to back off turn down the pass transistor (at which point there's no longer an advantage to a low-voltage-drop transistor).

If you want to deliver a high charging current, with good control and low losses, under a fairly wide range of conditions, I think you'd probably want to use a different approach... use a buck-mode switching regulator rather than a linear pass-transistor system. With that approach, the pass element would almost always be fully-on or fully-off, and thus there'd be a real benefit to a low-resistance MOSFET or a low-saturation power bipolar part.

Of course. His kit includes only the PC board and the PCB-mounted components anyway, so I would have to provide my own enclosure and heat sink (well, maybe it does include a clip-on heat sink; I don't recall).

My idea of using a MOSFET was to avoid the voltage drop of a junction transistor so that it could be fed from a regular P/S that has been cranked up only a little -- as with the "Super PwrGate," which has a voltage drop of no more than 0.5V; any idea what West Mountain Radio uses to accomplish that? So Vsupply - Vbattery would be low, and also the power dissipation.

I'm trying to avoid switching-type circuitry, since I already have RFI-quiet regulated power supplies that are capable of supplying the desired maximum voltage and current. It's just a matter of reducing the voltage at the appropriate stages of the charging/maintenance process.

I was looking at the Super PwrGate until WMR's tech guy pointed out that the absorption voltage is too low and the float voltage possibly too high for flooded batteries. If I knew that it used a UC3906 and did not use SMT components I might be willing to try modifying one, but I don't have that information.

There is no design on the internet for charging a flooded lead acid battery at the levels I use. There is a reason for this it's called lithium ion cells.

I used to make a living selling NTE parts. NTE always bought the cream of the JAN type transistors, so they could sub tonnes of transistors with one number. When the regulator went south on my car alternator I used a NTE180 to drive the field winding with a zener regulator I mounted the heat sink right to the positive side of the battery; when that car died the day the big tsunami hit back on boxer day 2005 I took the NTE180 out.

I use an NTE180 30 amp PNP transistor and 1 foot of 14 gauge wire to set up the main charge current, I use a 23amp PS from the filtered unregulated side to the input of the 14 gauge wire to collector of the PNP. the UC3906 looks at the voltage across the 14ga. wire and directly drives the PNP. I snake the wires for the emitter and base of the PNP thru the heatsink fins. I used the TI data sheet for the UC3906 to calculate the settings for the different charge cycles.
The 14 ga wire and the pass transistor are the only off the solderless board parts
I wound the 14 ga wire in a pancake style coil so it fits right over the heat sink

I had to use single turn trim pots and series resistors to set the different charge cycles from the equations provided by the data sheet on the UC3906

I did alot of research on my power supply, the others that used a UC3906 on the internet could not be used to recalculate the resistor values for the UC3906 for a large flooded lead acid battery. There were to many mistakes as I found out.
Using the TI data sheet, is the best way to go, it looks like rocket science but it's easy.\\

Hi all,
I finished the amp that had the 5 Ghz transistor, I changed it to a slower one.
The objective of this amp is to cause minimal loading of the circuit it is measuring.
When I install the box cover the voltage gain drops by 7%, so I think the input capacitor
plate is being loaded by the cover.
The input capacitor plates can be seen here;

http://i395.photobucket.com/albums/pp37/Qmavam/1cmx1cmspaced5mm.jpg

The plates are 1 cm x 1 cm spaced 5 mm apart.

I have thoughts about rectangular plates 0.25 cm x 4 cm to get more distance from the top cover, (and the bottom.)
Or a real gimmick cap where I twist a couple of 39 Gauge wires together and attach opposite ends to input and output.

Any ideas to minimize input capacitance to the box?

Here's the amp in box.
http://i395.photobucket.com/albums/pp37/Qmavam/Kleijerampinbox.jpg

This is the original circuit page with schematic;
http://www.crystal-radio.eu/enfetamp.htm
Thanks, Mike

PS, I was having trouble getting some close-up pictures, I grabbed a
magnifying glass and took some
pictures through that, works good.

The old-tyme gimmick was two wires, twisted together.  That would
contain the field better than your open plates.

Another alternative: you could surround your cap with a shield and
drive the shield from the FET source, bootstrapping it.

Hi James,
The twisted pair may be the easiest, but as a thought, if I took a piece of coax and
removed the center conductor leaving just the shield, then inserted a twisted pair as my capacitor.
I then connect the shield the FET source, Ok, I have never bootstrapped before, but wouldn't I
then have a higher potential than desired, even a possibility of oscillation?
Mikek
PS. Do I have any concern about inductive coupling with a twisted pair?

That's too tight a box, and the dielectric screws things up--you'll be
making shunt caps to the shield.

Higher potential? No. Possibility of oscillation? Yes, but not
likely. Keep the shield well clear of the gimmick to minimize that.

Just the twisted gimmick itself is probably all you'll need. The
bootstrapping is lagniappe.

Use a real surface-mount 0.3 pF cap, or a homemade coaxial cap. The 1
cm square plates are too big and have their own capacitance to the
world.
```

Bootstrap the drain of Q1.

"T" means transformer, which shows that this circuit was done by an
amateur. All that tricky stuff could be replaced by one opamp.

It could have close to zero Cin with a little positive feedback.

For that matter the tiny input cap in Mike's circuit is
counterproductive--it divides the signal down and makes the gain
unpredictable.

Better: use 10pF coupling, lose less at the input, and use less gain
later. Bootstrap the FET so the input sees very low C. Do those and
you don't even need a gimmick.

Warning!

The 2N3644 is a PNP. The app note probably meant some other type number
similar to that in an NPN.

  Ever consider simply using a proper air core variable cap?

One gotcha: with +12 on the drain of the jfet, expect a lot of gate
current. Hot carriers or some such.

If the jfet drives a non-inverting opamp with gain, one could over-bootstrap the drain to hit zero or even negative input capacitance; tweak that with a pot or a small variable cap. Then, as you say, dump the 0.3 pF input cap and have predictable gain.

You need to walk me through that, (I'm an amateur)

Ah, he's done some nice work on the subject of crystal radios and high Q
inductors.
http://www.crystal-radio.eu/index.html
Page down to experiment with LC circuits.

 > It could have close to zero Cin with a little positive feedback.

 How much closer? If the input cap is 0.3pf what do you the input impedance
is?
Input is 0.3pf, 20 Meg to ground driving FET gate.
                                  Thanks, Mikek

You have any 0.3pf  air variables.
Why is this one improper?

s, Mikek

We're talking about something roughly like this:

```
    +12V >-o-----o-----------.
           |     |           |
           |     |           |
           |     |       R5 3.3M
           |     |Q2         |
           |      \|         |        V1
           |       |---o-----o   <~~ ~=3D+3V
           |     .<|   |     |
           |     |     |  R6 1M
          R3     |     |     |
    C1     |     |     |C3  =3D=3D=3D
    10pF   | g |-'d   ---
in--||--o--|-->|      ---
        |  |   |-.s    |100n
    R1 10M |     |Q1   |
        |  |     |     |
        o--o-||--o-----o-----------out
        |    C2  |
    R2 10M  100nF|
        |        |
       =3D=3D=3D   R4 470 R
                 |
                 |
                =3D=3D=3D
```

C2 drives the center of the input bias resistor, which cancels the loading caused by R1-R2. This is called "bootstrapping".

Q2 does the same thing for the drain terminal--it causes the drain terminal to go up and down with the input signal. That saves the input signal from having to charge Q1's gate-to-drain capacitance, effectively making that capacitance disappear.

This front-end has *much* higher impedance than the original, and a predictable gain that's close to 1.

R3 is to bias the FET output to (V1)/2, for maximum dynamic range. Higher V1 would give bigger dynamic range.

A cheapskate could put a resistor in Q2's collector and use it as a voltage-gain stage too.

```

Oh, I didn't calculate the biasing, so R4's probably wrong.

It's not so inpredictable, I set the amplifier gain at 17 and then
adjusted
the capacitor spacing for a total amplifier gain of 1.
I'm not being argumentive, just trying understand.

I need to know more about bootstraping.
Also doesn't the 0.3pf cap reduce the loading effect of the 20 Meg resistor?

Thanks, Mikek

Change to a co-axial cap.

The input gain of the original circuit depends on the voltage divider
comprising your gimmick cap, on the one hand, and the FET's
capacitance on the other.

No two FETs will have the same capacitance, so you can't know in
advance exactly what the circuit's gain will be. That's why you have
to tweak it via the input capacitor right now.

Not really. At 1MHz, 0.3pf has a reactance of 530K, so it just adds
530K in series with 20M. It also attenuates your signal by a factor
of 17, if the writeup is accurate.

The author says the amp's input capacitance is 1.4pF. That means
either there's a lot of stray capacitance, or the input coupling cap
is actually a lot larger than 0.3pF.

Hmm. I might have got a hot FET as my cap is spaced 5 mm vs his 3mm.
I calculated 0.177pf for my cap.
Had adjusted the circuit voltage gain after the FET circuit for 17. Then adjusted the cap for a total gain of 1.

Oh, I had assumed a much higher impedance for that small cap.
Best not to assume :-)

I'll be trying the twisted pair to reduce that stray capacitance.

If the source of the fet follower drives an opamp with a gain of, say, +2, you could take the amp's output, run it through a pot, and AC couple that into the drain.

With the pot at zero gain, there's no bootstrapping, so the fet's Cg-d loads the input 100%.

With the pot at mid-rotation, the drain is forced to swing up and down just about as much as the input signal does. Since both ends of Cg-d are at the same signal level, there's almost no current in that capacitance, so it sort of disappears, as far as the gate is concerned.

Turn the pot a little more, and a small excursion at the gate results in a *bigger* excursion at the drain. So the current in Cg-d flows in the opposite direction from a real capacitor, and Cg-d becomes a negative capacitor. It can then be used to cancel all other capacitance at the gate node, making the box have a net nearly-zero input capacitance.

Or just add a small variable cap from the opamp output back into the gate, and adjust for near zero input capacitance. When it oscillates, you've gone too far.

John

Does the term SNIP have any meaning to you?

   Response before looking at others:
   1. use one 10Meg and connect it to source OR cap bootstrap the 10meg
input divider to the source.
   2. "wrap" a shield around the input wire & plate and drive the shield
from the FET source or T2 emitter.
   3 What the heck is that HUGE block attached to the input plate?
Ditech it; you will see a significant decrease in input capacitance.

I quoted the original post.  Did you think the original was
irrelevant?  I don't agree.

I try to quote enough so that a newcomer can, in one post, understand
both the full question I'm responding to, and my reply.

Thanks for the explanation James.  The bootstrapping of the base does
nothing for the input capacitance.(?) Is that correct?

That's too tight a box, and the dielectric screws things up--you'll be
making shunt caps to the shield.

  I tried a twisted pair of #26 wire and got way more capacitance then I
wanted.
I ended up with just about 1/4" layed side by side as about equal to 0.3pf.
When I put the cover on there was much less effect on the signal than with
the previously
used plate capacitor.
The side by side wire is not stable for long term use, so I'll find a way to

stablize it and
call this one a wrap. I'll try tying a low capacitance knot ;-)
I have two more boards and boxes, I'll build a bootstrapped version for the
next design.
I'll be back, I might try one with a gain of 1 and one with a gain of
maybe 10.

Just half a twist is likely enough--regular twisted pair is way too
tightly coupled.

If you mean "gate" and Q1, that's inherently bootstrapped by the voltage-follower configuration: the source already rises and falls with the input, leaving the Miller capacitance as by far the biggest nasty. The best, easy bootstrap for the FET input capacitance is getting the FET follower gain up closer to unity. That means using a current source for the source load instead of R4.

The input bootstrap above--C2 to the junction of R1-R2--serves to reduce the a) stray capacitive loading posed by R1, and b) raise the a.c. input impedance to much higher than the 20M input resistor in parallel with the FET gate impedance.

Try a glass cased diode with one end cut off so the case is empty.  Use

Uh yes... Gate of Q1. (thanks for reading my mind.)

I am looking for a clean well built HBR receiver to add to my homebrew
transmitter. Just about any will be considered, just needs to play well
and I work mostly 40 and 80 CW. I am good on Qrz.com for email. Thanks,
73 Jim N0XE

I graduated from college back in the 1994, and even then we were admonished to avoid magnetics whenever possible. Of course, these days I know better, but as a result my academic coverage of IF transformers was non-existant.

I'm now trying to make up for that transgression. :-)

I've done a fair amount of reading and have a good understanding on how IF transformers work, how they should be modeled, how to build them, etc. (Most of the books that address this in detail are from the 1970s or older, it seems...) I still have a few questions, though, that I'm hoping a few of the older reads could help me out on. They are:

1) The really big 450kHz IF transformers you see in tube sets... why did they wind the coils in the form of "pancakes" rather than "the usual way" (single-layer coils)? Is it just a consequence of needing lots of turns (to get enough magnetizing inductance) but, for the coupling coefficient desired, finding that you'd end up with, e.g,. a foot-long tranformer if you only used a single layer?
2) I can readily see why you'd want a center-tapped primary, or a primary with, say, a tap 10% "up" as a small feedback winding, but why do you get such things as an IF transformer with 103 and 50 turns on the primary (on either side of the tap) and then 27 turns on the secondary? (E.g., http://www.mouser.com/catalog/specsheets/XC-600014.pdf). None of my books address this, and the only thing that looks close on the web is this article: http://hem.passagen.se/communication/ifcan.html . Is his conclusion, "by tapping the transformer the Q value increases" the main reason?
3) Sticking a parallel capacitor on the primary to resonate out the magnetizing inductance makes sense to me. I'm a little less clear on parallel capacitors on both the primary and secondary -- a double-tuned arrangement. Hagen's "Radio Frequency Electronics" assigns leakage inductance to the secondary and then converts the resonating capacitor in parallel with your load resistance back into a series circuit and, voila!, you now have a series RLC circuit so clearly bandpass behavior... but this approach implies that you could just use a *series* resonating capacitor on the secondary instead. Is that correct? (I am aware that there are a handful of commonly used transformer equivalent circuit models, you can transform magnetizing or leakage inductances and losses from primary to secondary or vice versa at will, etc.)
4) Anyone have pointers to good books or articles that ideally discuss some actual design examples of the more complicated cases (weird primary turns ratios, double-tuned circuits, etc.)? -- The ones I've found so far as the simpler single-tuned case, just center-tapped, etc.

Thanks a lot... I appreciate the help here!

---Joel

  Because applying the lid changed the value.  Duh.

  That air gap is so big that even local electrostatic fields would fuck
with it.

Plagiarism from an earlier post aside, you are on the verge of offering
some legitimate advice. But your delivery sucks more than a vacuum.
Maybe you have a black hole. You should look into that. Literally.

Again, come back when you are not being your usual mouthy little bitch self.

Plagiarism? You're an idiot, and a goddamned liar, boy. I was making feedback circuit caps before you even knew what an antenna match was.

Short answer: yes.

Long answer:

That IF transformer is intended for driving a stage with an input impedance of 5K. When they say the primary impedance is 20k, they mean between pins 2 and 3. 50:27 = ~ 2:1 turns ratio = ~ 4:1 impedance ratio. So you connect pin 2 to the supply and pin 3 to the collector of your transistor and it sees a load of ~ 20k, ignoring coil losses. The 180pF tuning capacitance is connected between pins 1 and 3.   You could try to resonate it by connecting a much larger cap (1.7nF !) between 2 and 3 and not use the 1-2 section at all; but the smaller cap has higher stability, tighter tolerance and lower loss.

The 20k and 5k impedances are dictated by the nature of bipolar transistors.

The required bandwidth and IF centre frequency fix loaded Q.

Dynamic impedance and loaded Q in turn determine the reactance needed at resonance.

You could design an untapped 4:1 impedance ratio transformer to do the same job; but you would have difficulty achieving the required Q.

It sure doesn't take too much depth in the followups of this NG
before it degenerates into a pissing contest that two or more
uncouth jerks should have taken to private email.

Thanks Andrew, that helps a lot!

actually increases 1/(0.67^2) times rather than 1/(0.33^2) times, though; I've

To get the shipping that I will charge, I need the zip. I use FedEx or USPS.
I will sell to out of the USA, but I only ship to USA. (Foreign buyers need
US agents)
I accept PayPal, Checks on USA banks and U.S.Postal Money Orders. (I wait
for 4 Bank Days for check clearances.)
Inquiries and poffers usually will get my responses, but they don't get the items held
from sale to other buyers.

You should be getting a signal gain. The second gate is normally operated such that it switches the FET on an off as a commutating mixer. operated in this manner, it will have low intermodulation distortion but a high noise figure. I suggest you consult "Designing with Field-Effect Transistors." either the first edition by Arthur Evans, Ed., Siliconix or the second edition by Ed Oxner, Ed., Siliconix.

I just found cwbeacon at ftp://sunsite.unc.edu/pub/Linux/apps/ham/morse/
```

The C code is a little crufty but typical of 90's stuff. You have to
use sys/io.h instead of asm/io.h.

It worked on the one PC I had, that had a real parallel port.

Another option on more modern hardware without a parallel port would
be something like a WKUSB, to drive it you just open up a serial port
(over USB) and send. The WKUSB is really nifty.

I think the motivation is to simply make them smaller. Crystals have
been made from synthetic quartz for quite some time now.

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

Hey OT's

I've seen lithium batteries for the HT1000, but theri like 7,2 volts, there are battery adapters for cigar lighter sockets/plug that would have to run at 12.6 volts

My question is can I mod a nicd battery pack and use three A123
lithium cells in it?

=============================

The charge regime for lithium batteries differs from that for NiCad/NiMH
batteries. My Maha MH-C777plus charger has a switch for Ni<---> Li
batteries. Suggest you find out what's the difference,through Google.

Hey OM:

yeah I'm aware of the charge diff for the diff chemistries, I have
charger for multiple lithium cells. sounds like if I use 3 cells I
will need a cuck switching regulator to keep the voltage at 8.4vdc,
which is the max voltage charge of 6 nicd cells. Or just put 3 cells
into a 12.6vdc cigar plug adapter.

Hey folks, I was wondering if anyone better versed in analog electronics could help me out with an idea. I've seen various projects on the internet where people have repurposed old radio equipment for other uses, like using a CB to receive amateur radio frequencies. So stuff like that got me wondering. I have an old crystal-based scanner that belonged to my dad. It has a range of 30-50 and 148-174mhz. While police/fire/rescue have all moved to digital systems, I know that the city's public works still uses frequencies in the latter range. I'd like to be able to receive those, without buying several crystals. So I'm wondering if it's possible to create some kind of oscillator (LC-based or whatever) to simulate a crystal for this type of device. It wouldn't be nearly as accurate/stable of course, but I'm curious if it's possible.

I mean, I'm sure if one went in and started trying to physically modify it they could find where to directly inject an external oscillator frequency. But I'd prefer to keep it in its original state

if possible. That would mean I would have to work with whatever
circuitry normally generates the oscillation with the crystal. That's
why for starters I'm mostly asking in a broad sense if it's possible.
I know anything more detailed than that might be hard to offer without
knowing what's actually in the scanner (even I don't have a
schematic), but any insight would be much appreciated!

My father did exactly that with a 70's vintage Radio Shack scanner. He

I probably still have it somewhere.

Good idea wish I would have thought of that first,

There are a few 10wvdc caps in there but they are on secondary

hey ole man:

been there done that.

Scanners that used crystals are pretty straight forward in todays standards, no secrets there.
I made a living selling the crystals for those scanners.
Or you could do a PIC stamp based cpu that programmed from a regular PC could do what you need to be done.
a.k.a. frequency synthesis, and scan the scanner with just the PIC using the scanner as an IF

To beef it up would need sum front end work or, software to program out the images.

Transverters do that all the time and is very common place in ham radio.

Almost certainly, yes. The details would depend on just how the circuitry is designed.

You would probably want to completely bypass the existing crystal-oscillator circuit, and inject the appropriate local-oscillator signal (created by your new tunable oscillator) near the point where the crystal-oscillator signal is fed to the "mixer".

As to the type of oscillator you could use... you could build an LC circuit, of course. If you want something a bit more off-the-shelf, you could buy a commercial VCO (voltage controlled oscillator) module from a company such as Mini-Circuits... feed this a very-well-regulated control voltage, through a multi-turn potentiometer, and feed the VCO's output to the scanner's mixer.

The scanner documentation probably tells you what crystal frequencies correspond to which over-the-air frequencies (i.e. what the "offset" is). If it's a single-conversion receiver, the offset would probably be equal to the operaring frequency of the radio's IF strip and filters. You would need to build (or buy) a variable oscillator circuit, which would generate frequencies covering the correct offset range.

FO-

Yes it is possible, as others have stated.

The frequency of the oscillator is related to the Intermediate Frequency of the radio. One common IF is 10.7 MHz. As an example, a crystal frequency of 39.3 MHz would receive either 50.0 MHz or 28.6 MHz depending on how the radio's Radio Frequency stage is tuned.

Scanners commonly use 3rd overtone crystals in the 25 to 50 MHz range. Higher frequency crystals are possible, but maybe not practical. Therefore, the radio will usually multiply the oscillator frequency to receive the higher bands such as 160 MHz or 470 MHz. What this means to you, is that a Variable Frequency Oscillator (VFO) that covers 25 to 50

MHz (or whatever it takes, you work out the math) will work for both low
and high bands.

To avoid modifying the radio, you may be able to connect the output of
an external VFO to one of the crystal sockets. The original oscillator
would then act as a buffer amplifier. That is if you are lucky. Bad
luck would be if the original oscillator oscillates at some weird
frequency!

First of all, thanks for the responses so far, guys. The info is
certainly helpful. I'm not completely opposed to modifying the
scanner, but it's good to hear that I might not have to. I'm much
more optimistic now on attempting the project either way.

That may very well be the case. If I recall correctly there are high/
low ranges. The "low" range is 30-50mhz, with the "high" at
148-174mhz. Back when my dad used it we'd always assumed that you
bought a crystal for the particular frequency you wanted to hear, but
that may not have been the case!

It's a Radio Shack PRO-77a, by the way, which I saw someone comment
elsewhere that Radio Shack tends to use 10.7 for the IF on that
brand. A shame I can't find any kind of service manual or something
for it.

While it may be technically interesting, I am amazed that one would consider embarking on such a project...

At least here, scanners have become mostly useless because so many services have switched to digital, and uncountable unused "computer scanners" (= those that already have a frequency synthesizer) are floating around.   A search on a secondhand marketplace site returns tens of "for sale" scanners sold for maybe $10. Just get one, and key in the frequency you are interested in.

(remember that solutions with a VFO will mean you lose the scanning capability so you can monitor only a single frequency at a time, and unless you add some digital readout you won't even know to what frequency you are listening)

I'm looking for charger/maintainer -- either an off-the-shelf unit or a schematic so I can build my own -- suitable for a flooded deep-cycle battery, either a pair of 6V "golf cart" batteries in series or a Group 31.

I don't want an RFI generator: I already have one.

I already have a few 13.8V 25A power supplies, one of which I would be quite willing to "crank up" to a higher voltage to compensate for the voltage drop in the control circuitry.

Something like the West Mountain Radio "Super PwrGate" (PG40S) would work, although the automatic switch-over feature is not essential. That device is intended for Gel-Cell and AGM batteries and not recommended for flooded batteries -- absorption-charge voltage too low and float-charge voltage too high, their tech support people tell me.

I am quite happy with my IOTA DLS-45 with the IQ Smart Controller

http://www.iotaengineering.com/iq.htm

Once a week it equalizes my batteries using 14v pulses. The batteries are on their 14th year and can still run my shack for 5 days. (down from a week when I initially purchased the batteries and charger)

I wish I'd known about that IQ unit before I bought an Astron RS-35A
just a month or two back.

I was hoping I could find something not too expensive to take power from
that P/S or from one of my RF-quiet "switchers" to look after the
batteries. Texas Instruments has battery-charging ICs, but I haven't
seen a practical circuit that uses one.

Hey OT:

I used to charge a deep cycle flooded marine battery with the TI

UC3906
data sheet here: http://focus.ti.com/lit/ds/symlink/uc3906.pdf
all you need is a few precision pots and the low resistance resistor
you need to set the max charge current.
I had a 115AH deep cycle flooded marine battery that with a straight
no frills charge took 4 days to charge fully, tested by hydrometer
With 1 foot of 14 gauge wire for the max charge resistor and precision
10 turn pots to set the other settings, and a 30 amp PNP pass
transistor on a fan cooled heat sink I was able to charge that battery
in 8 hours full charge, then it goes to a maintain charge, not a
trickle charge.

Basically I was charging at 23 amps after the UC3906 checked that no
cells were bad, then once it gets to a predetermined voltage it scales
back the charge, all the levels for this are set by multiple precision
pots and you can take it thru 4 levels of charge. I had the max
setting for 15.5 volts when the battery was fully charged to roll back
to maintain charge.

You will need a unregulated 18 volt supply, because the PNP drops 4
volts in VSAT. and once it gets the battery up there in voltage, the
PNP doesn't need to be full on in VSAT

After using auto chargers and straight charges I found the UC3906 the
best choice over all.

There is a switch mode TI chip also but you don't want that one

Mouser stocks these last time I bought them it was like $4 each.

You do not need anything too fancy...
to "float" the batteries all you need to do is keep them at approx 2.25
volts / cell...so it's possible that your 13.8 v charger will do the job...

You can test it by checking the total voltage after a 24 hour period...

ideally, a 12v battery should float at about 13.5 volts.

If the float voltage is a little higher or lower it won't be too
critical...but make sure it's well below the 14.2 v gassing point.

I've been in the lead-acid battery business for 36 years...
so have quite a bit of long term empirical data

Hey OM:

All well and good but taking the battery up to 15.5volts is ok as long
as you keep adding water and have a well vented area to charge them
in. I tried a tested and true way of not going over 14.2 volts took to
long to get the full charge you can check it with a hydrometer and see
that best you can get is 80% of full charge going with 14.2 volts.

With a 18volt unregulated supply and the VSAT of 4 volts the max
charge current voltage can only be 14.00 volts period
you have to take it up to 15.5 volts to get the full charge period.
been there done that.

West Mountain Radio claims that their "Super PwrGate" has a voltage drop of only 0.3V to 0.4V, so they can charge a Gel-Cell battery from a 13.8V P/S or can handle an AGM battery simply by raising the P/S voltage to 14.1V. Any idea what they use for a pass transistor?

The "Micro M+" solar battery charger described in some recent editions of the ARRL Handbook uses the STP80PF55 P-Channel MOSFET (80 Amp, R[DSon] = 0.016 Ohm) as the control device. Could this be used in conjunction with the UC3906 without too much difficulty?

That's the entire point of float charging a battery...
you do not have to add water and you do not have excess hydrogen
production...in "normal" charging...the battery voltage would rise to
approx 15volts during the last 20 minutes or so of charge

The OP specifically said he wanted to float charge

The West Mountain Radio people told me that their "Super PwrGate"'s
13.5V float setting voltage (not adjustable) might be too high for a
flooded deep-cycle battery. Their user manual refers users to

www.windsun.com/batteries/battery_FAQ.htm

which recommends per-cell float voltages flooded deep-cycle batteries
that translate to 13.02V to 13.20V for a 6-cell battery.

Oops! I was writing from memory and got it wrong: West Mountain Radio specify cranking the P/S up to 14.1V for Gel-Cells and to 14.5V for AGM batteries -- to allow absorption-charge voltages of 13.8V and 14.2V, respectively.

And the voltage drop is 0.25V to 0.5V, depending on current.

That link did not work...but really, the exact float voltage is not that critical...the free gassing point of a lead acid battery is 2.37 volts /cell or 14.2 v for a 6 cell battery...

to float the battery you must stay reasonably below the gassing point or there will be considerable water consumption...hydrogen and oxygen production and heating.

OTOH: the nominal open circuit voltage of a fully charged lead acid battery is 2.12 volts / cell or 12.7v for a 6 cell battery....

so anywhere from 13.1 - 13.8 volts would work for "floating".

Back in the old days when I started in the industry,
the settings on the chargers could drift a bit...so we'd try to keep everything in the middle of the accepted range or about 13.5 volts

If the battery is going to be on float for an extended period of time... though the water consumption is minimal...it still needs to be checked periodically and topped off as needed (never fill a battery up into the "neck" area...the water level should be a bit below it)

Finally...a few times a year the battery should be equalize charged to
avoid the possibility of sulfation. Usually 6 hours will suffice.
The battery should be brought up to 14.2 volts and allowed to rise to
approx 15 volts depending on the type of charger

The "Super PwrGate" claims to take care of all phases except equalizing -- but only for Gel-Cell and AGM batteries. "No Spam" says that the Iota/IQ system even does regular (weekly!) equalization charges.

I was hoping to find or build something cheaper that could serve as a controller to make use of one of the power supplies I own already as the power source.

I'd give one of your power supplies a try and see if it gives you an
acceptable float voltage...

If not, then one of the commercial ones would probably be a lot easier
than trying to build one yourself

Hey ole timer:

First and formost this is a homebrew group.
To suggest to not build and to buy a commercial of the shelf reay to
use product, is like those sex ads that get posted here, they both
have nothing to do with homebrew.

Lastly I built a flooded lead acid charger. I only bought one part the
IC UC3906, I already had a solderless breadboard, the resistors and
capacitors in my junk drawer
The hardest part was figuring the resistor values and how to make
those values, and that was easy.
The heatsink fan came from an old CPU fan heatsink, and I mounted the
pass transistor to that heatsink fan.
I think that the UC3906 was the best think since sliced bread

So stop cross-posting to rec.radio.amateur.equipment

That's EQUIPMENT.  Commercially built as well as home brew.

I guess it's my (the OP) fault: I cross-posted my original question --
asking about off-the-shelf or homebrew solutions -- to both
r.r.a.equipment and r.r.a.homebrew, and all the responses have gone to both.

I've seen schematics and board layouts for SLA chargers based on the UC3906. VK3EM's uses SMT components, while N5BIA's uses discrete components -- but both are only for charging currents of 2A or so.

For what current did you build yours? If high-current, what pass transistor(s) did you use?

N5BIA offers a kit, and I was wondering whether this could be beefed up

```
to handle 25A by adding 12ga wire to all the charging-current traces and
substituting higher-current pass transistor(s). I'd have to recalculate
the resistor values to suit a flooded battery, of course. And what about
using a P-channel MOSFET device, such as the STP80PF55 that the "Micro
M+" uses?

You can take my advice or leave it...
that's up to you.

I'm a senior service engineer who's been in the (lead acid) battery business for 36 years.

I assure you that "float charging" a battery is not rocket science and you do not have to get too fancy

(but if you want to, that's fine)

Hey OT:

I looked up www.sm0vpo.com/  your ip addy, and it's 81.227.194.25, and
bam your web page pops up.

Although lookup was able to find your ip addy, my browser isn't able
to get to 81.227.203.235

Hi all,

For my RF project, I want to measure vswr readings, in order to
that I was planning to construct a VSWR meter. The concept of VSWR is to
calculate the ratio of Voltage transmitted to the Voltage reflected. So
my basic question is,

1. What sensor/instrument is used to measure the voltages from the coax
cable(in my case)?

Please some one help me with some ideas

There are several means depending on frequency used, transmission lines,
sampling transformers and other like resistive bridges.
One useful source could be to look at N2PK web page, he has done
measurements for HF range bridge.

Dont know where you are, but get yourself a copy of the ARRL handbook
- doesnt matter the age - and all will be explained....

Hey OT
:

Most so called VSWR meters will give you a reading but is it a true reading? Not likely, by the time the reflected wave comes back down the cable it has lost some voltage because of cable losses.

A true method would be to measure the voltage at the antenna, telemeterize the voltage reading and send it back to the VSWR meter to compare to the output voltage of the tx. And use a dual cross meter so the ratio is calculated by the meter scale with no adjustment needed. Except to calibrate it just once.

73 OT,

===================================
Is it really important to KNOW the actual VSWR?  I don't think so.

I use a swr meter to be able to adjust the Antenna Matching Unit (I
don't call it a tuner) for zero or minimum reflected power ,just to
'keep the transmitter happy'
If the swr meter shows a different level of reflected power at a
specific setting of the AMU for a specific frequency,using a specific
antenna ,then something is lilely wrong with the antenna or feeder.

When adjusting the AMU for minimum/zero reflected power ,for final
adjustment I set the swr meter at maximum sensitivity.

Currently I only use a 'doublet' = a wire dipole with twin lead feeder.

The first question is why ?

If you want to tune some HF antenna to resonance within a specific
ham band, just use a noise bridge and adjust the antenna dimensions
accordingly.

For VHF/UHF, the antenna dimensions are even more critical, i.e. the
antenna feedpoint impedance should be the same as the feedline
impedance. Due to the cable losses, any ATU at the lower end would be
completely unacceptable.

On the webpage http://www.crystal-radio.eu/engev.htm the author diagrams a crystal radio with Rp as the losses in L1 and C1. Then he goes further and loads L1C1 with an antenna, this reduces Q by 1/2.
He then adds we can calculate the value of Rp as follows: Rp=2.pi.f.L.Q (Q Unloaded).
My question; Why does he do all further calculations with Rp rather than

1/2Rp, since the Q of L1C1 is
reduced to 1/2 by the antenna loading.

From what I read, I guess:

1. He works out the optimum match between antenna and LC tank.
2. She investigates the optimum match between LC tank and load
completely unrelated to 1.

OTOH, I would be glad to find a reference on how to accurately derive
the proposed equivalent circuit of the diode detector at low signal levels.

Ya, that's what it looks like to me, I sent him an email, but it looks like
he is
not responding to any, his store is closed also, at least for now.

Here's a bunch of information about diode detectors in crystal radios.
I think the first one will answer your question, but Ben Tongue has great
info too.

I received a reply to my question from the webpage author.

"In the formule Rp=2.pi.f.L.Q , I use the Q of the coil in the right-side
part of circuit diagram 2.
This Q is halve the value of the coil Q in the left-side part of circuit
diagram 2.

I consider the right side part of diagram 2 to be a new unloaded circuit,
with it own unloaded Q.
With unloaded I mean here "not loaded with diode or loudspeaker".

Maybe one might say; it's not unloaded because the antenne is connected"
But as you see in circuit diagram 2, in the right side part, there is no
antenne anymore.
It's just a new LC circuit with it's own Q value, wich we are gonna load
with diode and speaker.

The calculated value of Rp is the value which the diode sees, in the situation with the antenna connected"

Thanks! I have also found that the Agilent datasheets provide a lot

I'm designing a small circuit for use in a QRP transceiver and i would
like to use an IC I have seen somewhere on the net which consist of a
single flip-flop and 2 or 3 logic gates (seem to recall they were
3 inverters or 2 OR's and 1 AND.
I'ts similar to 74HC7074 but this one is very old.
Does samebody remember the part ID for such an IC ?

Thanks, Andrew.

UHF homebrew transmitter with a PL-4D21 tube. Great looking. A Motorola
Power Supply that has the high voltage transformer already removed for
shipping. However, I don't expect that anyone wants to pay for what I
would
charge for packing this PS and transformer. So this is for pickup here
in
Auburn. The actual net weight is: Transmitter 8 pounds. Power Supply
75
pounds. and the transformwer 50 pounds. If I pack, will want $75 for my
labor and materials, plus the actual FedEx charge.
I know nothing more than what one can see about these items. I would see
the power supply with transformer separate only after the transmitter is
sold. I have no way of setting a price for these items. Please make an
offer.

I think the 5763 tube requires 0.1W class C RF drive for full output.

Can anyone point me please to any solid state HF RF drivers that would be handy for driving this tube? Possibly with digital readout. I don't have recent radio handbooks. Thanks.

Oh, I am thinking CW. Not an SSB RF exciter.

Hi, one now already somewhat "museum age" design was once described in
VHF Communication magazine 1/1982, A Wideband driver for the Shortwave
bands, if available... Still useful and solid desing.
There could be other equal designs somewhere with modern wideband
op-amps etc. but this would give HF range gain of 44dB and is linear,
not in C-class but can set to run in class C...
It will also drive tube amplifiers nicely with 1:4 step-up transformer
at tube grid...
This is not really a kit, but could give some new views to your needs.

Hi.

I've just got the RSGB handbook from 1973. Possibly a little old in the tooth.

I could do with the latest RSGB edition, ARRL handbook, or some sort of cook-book. Probably. :c)

There are probably some wideband designs or otherwise on the WWW. Just a matter of finding them.

Maybe I should spend some money on a new book. :c)

I would think most VFOs could do this with the proper impedance
matching.My friend did something like this and either used a 4:1 or
16:1 stepup transformer to drive the tube. I think he used an HP
signal generator at one time to drive the circuit which was a 5763
driving a 6146B.

Celebrex is employed in the management of signs and symptoms of arthritis. Including pain, stiffness, swelling and inflammation. The medication won't cure arthritis, but provides symptomatic relief. This is a nonsteroidal anti-inflammatory drug (NSAID) which relieves pain and inflammation. The drug sticks to blocking the production of prostaglandins in the body. Prostaglandins contribute on the pain and swelling connected with arthritis.The ultram mechanism as described above is much like the mechanism used by narcotics. Acetaminophen naturally could be the active ingredient in Tylenol. It works by increasing the threshold to pain (i.e. it requires more pain stimulus to make the sensation of pain). These two drugs work by different mechanisms, and they combine being more potent than either drug alone.' buy phentermine now ' (http://www.fengshuimasterwong.com)In america, the particular create along with purchase regarding Over the counter substances is regulated from the Fda (Fda standards). Andrew,

I don't know which IC you mean but you could use a Quad NAND IC (74x08 etc)
and use that to make a flip-flop out of two of the NANDs which leaves two
NANDs spare for other purposes.

Hey OM:
I beg to differ:
7408 plus 7404 on the outputs is a quad  NAND gate plus 2 inverters.
And I can stack that 7408 on top of a 7404 IC and make it multi
function, on steroids.

Hey OT:

I think what you has seen is a cd4046 internal workings like this TI

Hello, first thanks for your comments and suggestions, and
sorry for my tri-post...sometimes thunderbird combined with my nerves
make for such nasty things.
Regarding the IC, please look at:

http://www.qsl.net/va3iul/Homebrew_RF_Circuit_Design_Ideas/Single-IC_Keyer_W9HFM.gif

and you will see a CW keyer build around a single IC (MC787P in this case).
So yes, such a rare beasts exist ...lol. They consist of a J-K flip-flop
and 2 or 3 gates. The problem is that they are dated back from the 70's
and doesn't exist anymore, so I was looking for a more current one.
Thanks anyway and happy new year !!

Andrew.

These days, people designing an entire circuit around a single IC use
a microcontroller. E.g. a PIC or something from AVR.

You might be able to duplicate the circuit by using CMOS chips instead of
hunting forever for the MC787P. The 4009 (hex inverter) or 4010 (hex
buffer). Due to the way they're drawn on the schematic, I'm assuming that
all three of the gates in the MC787P are inverting, so you would use the
4009 for those. A 4027 could be used for the JK flipflop. The CMOS chips
will work down to the 3.6 volts specified, so that shouldn't be a problem.
The 1N270 diodes are germanium signal diodes, and are still available. The
2N4888 transistor replacement is the NTE288.
You should be able to find all from Mouser.com.
Good luck with your project.

Hi!.
I built a basic Pierce oscillator: emitter to gnd, about 33pF at B and
C, xtal from B to C, 180kohm from B to C. Feed thru choke. x10 scope
probe at collector.
With 3, 6 or 10MHz xtals, I sweep Vcc from 1.5V onwards, no problem.
With 24MHz, or 22MHz (actually a 110MHz 5th overtone, oscillating here
at its natural f), at first the amplitude increases gradually with
increasing Vcc, the negative peak being far from saturating the
transistor. Suddenly, at some Vcc the amplitude increases to near
twice Vcc and the transistor saturates at the negative peak. Going
backwards with Vcc, I also find hysteresis in this behavior.
I tried a different transistor model with same results.
Frequency shifts a mere 100Hz when jumping amplitude, so it doesn't
seem the xtal is falling into some spurious mode.
If using 1.8kohm to feed the collector, I get a nasty
superregeneration envelope.
I have read thin quartzs must be driven with lower levels to avoid
mechanical damage. But could it be that high levels produce an
instantaneous (not temperature related) lowering of the series
resistance? (which in turn causes more drive, hence more R lowering,
etc.).
Just in case, I will try a Butler oscillator (tuned at the natural
frequency, not an overtone as usual) because it imposes much lower
drive, but I will be glad to hear if anybody had a similar experience
with the Pierce.
Many thanks!

You might wish to consult the chapter on crystal oscillators in "Vacuum Tube Oscillators" by William A. Edson. In particular you should read 9.9 Power Output and Crystal Dissipation in the Pierce Oscillator. You might also wish to read the section on the Miller oscillator. Don't let the "vacuum tube" title scare you away as the book is really good at fundamentals. Do a Google search for this book. At one time, someone had graciously posted copy in Adobe format.

Barry, many thanks for suggesting this book!. Don't worry, I have a
great esteem towards vacuum tubes and their underlying time-defying
principles (after all, the book is just 4 years older than myself...).
Power applied to the crystal by a tube oscillator is surely higher
than in an equivalent solid state counterpart, but 50's xtals were
also bigger (e. g. FT-243 format) and with metal contact plates that I
guess contributed to dissipate heat as a side effect.
Honestly, it adresses the crystal dissipation from a frequency
stability viewpoint, not quite my present concern, but I have found
interesting material in different chapters for other projects at home,
such as induction heating, and analysis of intermittent behavior. And
now I admit I didn't understand the principle behind the Miller
oscillator.
Ok, I will do some more experimenting and web search, and will
eventually post the results.

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Actually this is not a forum although to a newcomer it may appear as one. It is actually a Usenet newsgroup for amateur radio operators who build their own radio equipment (homebrew). If you are into brewing beer at home, this is not the newsgroup for you. But if you are a ham radio operator who currently builds his own radio equipment, or one who wishes to begin, let me say - welcome to the group!

It might be a good idea to understand how a Usenet newsgroup operates, so a little reading on the subject is in order. Start with a Google search. When Usenet first began, news about ham radio was one of the earliest groups. I first began using Usenet in 1983 and have continued sporadically ever since. Usenet predates the Internet, by the way. As traffic grew, more newsgroups were added to allow readers to pick specific groups where certain topics were discussed. I have no idea how many newsgroups exist today, but the number is well over 300,000, most of which have no traffic. The ham radio newsgroups usually have a moderate amount of activity, especially the rec.radio.amateur.antenna newsgroup. You will run into newly licensed hams, to those with much more than my own 46 years as a ham.

If you have technical questions, Usenet is a good place to get answers. You will find readers that have little experience to real experts in particular areas. Beginners are always welcome on Usenet as we all were beginners once. We also have a truly international base of readers too, much as the hobby of amateur radio has hams from almost every country.

So welcome to Usenet and welcome to amateur radio homebrewing. And if brewing beer is more to your taste, try the rec.crafts.brewing newsgroup.

All radiobanter.com is doing is hijacking Usenet newsgroups, and making
you "think" that they have a bunch of active forums.

Go directly to Usenet with a newsreader, and skip all the ads that
radiobanter.com puts up.

People whine because Usenet is losing participants and people whine when
HTML net portals encourage activity.

I've come to the conclusion that 'people whine a lot'.

With that said...carry on soasuafrito.  And welcome to the venue.

Ray-

I'm guessing that frequency could be used to convert one of the bands on a Heathkit SB or HW 100 series transceiver to 10 MHz.

If you're willing to accept a dial error, a crystal might work if it is as much as 350 KHz lower in frequency. I think that would move the tuning range from 10.0 to 10.5 MHz down to 9.65 to 10.15 MHz. Or a crystal up to 100 KHz higher would move the range to 10.10 to 10.60 MHz.

Otherwise you will need to order a custom crystal. The major crystal companies should have data on the Heath heterodyne crystals if you explain what you want to do.

Many thanks Fred, as you so rightly deduced,
I want to use the crystal to convert the 10.100-10.150Mhz
band down to within the 500Khz tunable range of 8.835-8.395Mhz,
It will be used in a bank of other ex-Heathkit crystals in a multiband
converter running into a homebrew receiver.
I will see what some crystal manufacturers have to offer.

With your tuneable range ,for 10.100-10.150 MHz you can use any crystal
in the 18.495 to 18.985 MHz range ,probably even a low cost
microprocessor type.

Yes but it would be nice to include 10.0000 somewhere in the range to
get WWV.

Using the crystal for 18.495 MHz would only permit tuning between 9.6 -
10.1MHz.
The higher 18.985 MHz would be better giving 10.09 -10.59 MHz.
The ideal crystal frequency is still 18.895 MHz. (10.0-10.5 MHz)

This isn't a "forum," it's a USENET newsgroup.

The fact that you're reading it through some Web site doesn't change
that.

Those "portals" often don't indicate where someone ends up, they want to
```

create the illusion of being local to the website. Google is bad enough, not quite hiding it but too easily trying to create an atmosphere that covers up the fact that someone is reading Usenet and would be posting to it, compounded by their "groups" that the interface seems to favor.

These messages are a clear example. Clueless people are posting, because they can. Two or three in a week's time. They don't know, or don't care, where they are, none of the messages indicate they have any interest in building amateur radio equipment, or even that they know where they are.

There is nothing to indicate these posters are actually trying to communicate about amateur radio. I can't figure out the purpose, but it's not been uncommon to see such messages in recent years, as if they hope to get a response for some reason yet to be fathomed. And people are actually falling for them, greeting them.

I don't see much spam, but it's noteworthy that not only is there spam I see here this week, but one instance of it is even originating from radiobanter.

Over in rec.radio.amateur.equipment, there are suddenly two posts, oddly similar, that have nothing to do with amateur radio, but about playing hobby DJ, and both posts derive from radiobanter. Oddly, since they both seem similar, one wonders if the same poster posted twice. Odd how suddenly there are two posts in a week about broadcasting in a newsgroup about amateur radio equipment.

This radiobanter is clearly abusing usenet, since they have now set things up so any idiot can post, and they are indeed attracting the idiots.

Hello all,

I am trying to put a co-ax line through the wall of my shack. I purchased two chassis mount N-type connectors a while ago, one for inside and one for outside the shack. As you will know these connectors have a solderable centre pin for the co-ax inner conductor and seem to rely on the chassis for the outer connection.

My question is if I use a metal enclosure to mount these N connectors how do I connect the centre pins together. Do I use co-ax with the braid disconnected at both ends, or one end, or do I use wire, or just put the chassis mount N-types to one side and buy some in-line N-types?

I am not too worried about the mechanics of putting the enclosure on the wall.

Any help would be much appreciated.

JOHN

You don't mention what frequency you are operating on; that makes
quite a bit of difference.

Also what the distance between the two connectors is.

Anything that is small compared to the wavelength of the signal you
are trying to transfer is not so critical.

So on 3.5 MHz you may be able to use a simple wire, while on 3.5 GHz
is is really important to maintain coaxiality.

    You incur loss in each connector (.2dB?). I would run the co-ax
through the wall and then put the fitting on inside.

I'd skip that and run the coax through the wall with no fitting whatsoever

They make a flanged coax connector for RG type cable. You can put two of those back to back with enough coax to get you thru the wall. OR, You can just have a 3" Pipe Nipple with screw on Deck Plates made long enough to pass thru the wall, and then when you have run all your coax lines thru it, fill the voids with spray foam..... done those, many times..

John-

The chassis mount N connectors should come with a "back shell" that allows the center pin of Co-ax to be soldered, and the shield to be soldered to the shell. If transmitting, you need to maintain the shield to prevent your signal from being leaked from the unshielded wire. The unshielded wire will act as both a loop antenna and an inductive reactance in series with the center conductor.

As others suggested, feeding the Co-Ax through the wall may be the best approach. There is a plastic tube available for doing that. It used to be sold by Radio Shack as their model 15-1200A "Wall Feed-Through Tube", but I can't find it at their web site.

Another approach is an MFJ-4602 "Window Antenna feedthru panel". It has three Co-ax plus balanced, single wire and ground feedthroughs. The panel is meant to be mounted on a window sill with the window closed over it.

Thank you for your comments so far folks.

J Todd and Philo, putting the cable straight through the wall omitting the two connectors is certainly worth me considering.

Rob, to answer your questions I will mainly be using frequencies up to 146MHz but with the hope of going into the low microwave bands in the future. I will be able to put the connectors back to back so their centre conductors can be soldered directly to each other. This would mean that the connector bodies are about 10mm apart.

Thanks again,

JOHN

Some of us have no choice but to use web portals such as Google Groups
because their ISP shut down their news server years ago (in my case,
news.gil.com.au =97 has been inactive for some time now).

Google Groups clearly states the following when posting:

> The group you are posting to is a Usenet group. Messages posted to this g=
roup will make your email address visible to anyone on the Internet.

If I could use NNTP to access this group, I would.  I'm not made of
money to pay for one of the commercial NNTP services, and sadly
they're not based in this country so I cannot pay them by bank deposit
or in-person.  Telegraphic money transfers are too expensive to be
sending small quantities of funds on a regular basis.  (I do not have
credit cards or PayPal, and refuse to obtain either.)

I think the spam sent to this newsgroup (which from what I can see,
PayPal appears to condone as every single one of the spammers offers
"PayPal" payment) is a bigger menace than people confusing web forum
for newsgroup.

Out of curiosity, what's the difference between the "microprocessor"
type crystals and other crystals?  Is it just frequency stability or
is there something more fundamental?

Could you cut a small piece of copper pipe of the right diameter in
half then solder it around that centre pin?  Simulating a small piece
of hardline coax?

Hi Stuart,

There are free NNTP services out there. One that many use is eternal-september.org (or something like that). To me the HTML interfaces are horribly cumbersome and having used Google Groups myself in the past the amount of spam is quite annoying.

I've seen some 'legitimate' posts coming out of radiobanter on the various groups. Not sure that's the case with this particular one, though. I try not to judge people based on who their ISP is or how they reach Usenet. Its apparent that quite a few people do :(

As for PayPal - I'm sure they don't give it a second thought!

Crystals traditionally were not commodity items.  They were ground
on demand.  Rare exceptions would be frequencies so common that
it wouldn't be a waste to make them ahead of time, so 100KHz
crystals were pretty standard.

WWII kind of spoiled people, because there was so much surplus
afterwards that for a long time, one could get a crystal "off the shelf"=20
because it existed as military surplus.  You'd either live with a crystal=
=20
"close enough" or open it up and grind it so it fit.  All those surplus
crystals allowed for people to make crystal filters when single sideband
became popular in the fifties, a lot of VHF work was able to use surplus
crystals in the 8 or 6MHz range (when the transmitters would be a string
of multipliers to get up to the desired frequency), there was even
  enough that worked on the HF ham bands.

When 2M FM came along, that was a shock.  Suddenly "close enough" wasn't,=
=20
since it was channelized, so there was an illusion that one suddenly=20
needed to have crystals ground to frequency, when that had been the
case all along.  It didn't take many years before that got old, which is
when frequency synthesizers really took off in amateur radio.

An odd exception seemed to be CB crystals, where you often could buy off=20
the shelf, or at least on a very short wait.  But they too were ground
just like all the rest, only the cb set's manufacturer saw there'd be=20
demand so they built up stock.

It was the rise of digital circuits that caused the growth of commodity=20
crystals.  ICs would be designed to use a specific frequency, that often=20
looked pretty odd until you divided it down, and these ICs were used=20
enough that the crystals became available off the shelf.  Some companies
```

tried to make use of existing commodity crystals, such as the very common color subcarrier frequency 3.58MHz, but that didn't always work.=20
Initially it was a fairly small set of commodity crystals, but more than the 100KHz and a few other frequencies seen before. "Microprocesser=20
crystal" is probably a misnomer, since they could often use whatever frequency was available, but other things needed very specific things. The variety of crystals multiplied as new ICs and gadgets came along, until there was quite a few.

Commodity crystals likely are lower spec'd, certainly you have to make the circuit work with the crystal rather than have a circuit and spend the money to have a crystal ground to fit that circuit.

But the real reason they are cheap is they are mass-produced, because the demand is there. So long as you can make do with what other people want or need, then you can get cheap crystals. It's not unlike the=20
decades after WWII when there were all those surplus crystals, you lived with what there was (but there were so many, it often wasn't a hardship).

Stuart-

Michael's explanation brought back memories of my teenage years and home-brew crystal controlled rigs.

A shorter answer is that a microprocessor crystal frequency may not be critical while a radio crystal frequency may be.

It would be critical if you needed your transmitter to be on an exact frequency. In your computer, it wouldn't matter much because no one is listening! The only time it would matter is if the crystal frequency is used to keep the computer's clock accurate.

Hi Michael & Fred,

Yep=85 economies of scale, I can grasp that.  So I'm guessing the main
difference is that one is tuned to a frequency that's more suited to
RF applications (e.g. maybe 455kHz) whereas microcontrollers will be
whatever's convenient for the microcontroller in use.

I was thinking maybe the microcontrollers were somehow less accurate
with the frequency.  Of course the fact that they are mass produced
would make them cheaper, but I thought maybe they had taken shortcuts
since microcontrollers are less critical.  (For timing purposes, a lot
use a 32.768kHz crystal.)

Thanks for the informative post however.  Guess I'm spoiled having
never lived through this earlier time. ;-)

Regards,
Stuart Longland

Yes ,I have done that at my QTH allowing the coax to run inside suitable
plastic pipe ,which preferably can pass the coax connector as well.
On the outside the coax inside the plastic pipe can be best sealed with
'Bluetec' that never hardens but remains sealing well.

What is your "RF project"? What frequency or range of frequencies? What power level?

Pretty much all SWR meters don't actually measure the forward and reverse voltages directly, but deduce them from measurement of the voltage and the current on a transmission line at a point along the line. Then, knowing that the forward voltage divided by the forward current (including phase) equals the line impedance, and also equals the reverse voltage divided by the reverse current, you can deduce the forward and reverse voltages (and forward and reverse currents). You use the line impedance in the calculation, and if you've assumed a line impedance different from the impedance of the line you're actually measuring, you'll get an answer that's not correct for your actual line. The "calculation" is commonly done with analog electrical parts in typical ham SWR meters, and there is generally a way to adjust the parts so that the meter reads correctly for the line impedance you want to use--but you must actually do the check/calibration or you won't know. (The calibration may involve just adjusting a variable part, or it may involve replacing a fixed-value part with one of a different value...not nearly so easy to get it right.) Also, the accuracy of many ham-type SWR meters suffers if you don't operate them at the right power level, because of non-linearity in the detector diodes; there are ways around that (e.g. using non-diode power detectors or operating the detector at a fixed full scale range).

It's also possible to measure just the voltage at a few appropriately-spaced points along a line and deduce the SWR more directly from those readings, but this is very seldom done in practice. See "slotted line measurements" for more details.

Cheers,

Tom

I have taken this as far as making my own hardline several feet long
from Cu pipe. Worked pretty good until it got moisture in it. You may
have a similar problem eventually. There are special bulkhead
connectors that are several inches long they are made similar to a
barrel connector that are made for your application. I got mine from
the Wireman.
Google is your friend here.

I was motivated to take a look. I downloaded the zip to this Windows7 deal.
I could not open the .doc (if that's what it was.)
Pity!   You probably mentioned the scorched galvanized sheet.
Oh well...

Hey OT
especially when he or she is posting from radiobanter.com and they
forwards the same post. that's like recrossposting, so the double
pleasure double the fun post on 2 sights.

I'll have my sheesh on a kabob.

pshaw to those, who like me, double post and don't know it.

=====================================
Yes Open Office is an excellent suite of apps
Since it is free nobody any longer needs the equivalent Micro$oft apps.

Well! Do some folks REALLY thing that an FRG-7 is good enough as it
stands!!!
First and most important problem, lousy selectivity, about 6khz BW with
very poor shape factor.

Secondly very poor AGC performance, this can easily be improved with an
HCD as AGC detector and better biasing of the AGC stage and detector.
Thirdly not very good RF noise and linearity performance. Easily improved
with a better FET, better biasing and introducing an RF gain control in
the G2 circuit, while keeping AGC action on the stage.
Finally too fast a tuning rate for easy SSB tuning. I am investigating
mods to the tuning mechanism to give me another 5 times slower rate.
BTW I have made 8 complete homebrew ham stations in my career and have
WAC and about 160 countries with them.
This INCLUDES receivers.
Admittedly an Xtal controlled CIO is a luxury, but I had found a not
inconsiderable drift in the original SEO oscillator that I had rather do
without. As has been said it makes the basis of quite a good receiver,
once a few bugs are removed.
After the RF stage my next target will be the first balanced mixer. It
looks to me as if the stage could be set up to reduce intermodulation
quite a bit.
However at my age starting right from scratch is not so easy so turning
a leather purse into a silk one is easier and quicker. My TS-820 has had
the same treatment and now runs ALL HF bands.

Actually, it's the Universe that sucks. Black holes prove that.

I tried reading and understanding most of the posts, but confess not understanding all of them.
BUT, I cannot resist inserting my "two cents" worth:

In olden days, it was quite common (but unwelcome) to have parasitic oscillations run away in large RF amplifiers. They would start all by themselves and quickly begin roasting tubes, coils, even adjacent conductive surfaces, whatever got in the way. The often encountered case would be a HF amplifier running away (self-oscillating for the unwashed) at a VHF or UHF frequency.

One common, but mysterious result was burned parts of RF chokes in the plate circuit. (you do remember tubes, right?) I think there were a couple of commercial RF chokes wound on long ceramic (steatite?) cores with assorted winding spacings on the ceramic core. Burned spots would occur in only one or two places on the length of the winding. Caused, supposedly by a high current node on a VHF or UHF resonant portion of the winding.

4 1/2 turns at 600khz must be an awfully low impedance circuit, but

could be right down the alley for VHF.

Brian has my vote for barking up the right tree.

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

  Here's the pdf on the core I think was used. The material was 3F3.
I don't know the gap size, I thought we generally used the 160 gap,
but I don't even see that listed. I decided it's more likely we used the
4229
than the 3622. It's been 10 years so details have faded.

Hey OT:

I stand by my proximity effect.

The Q is equal to Rl/Xc the half turn has twice as much Xc so the Q
for that turn is half as much as the other turns because of proximity
Thus the Pd in the half turn is 4 times the Pd in the other turns.

Another site they used 2, 1mh coils in close proximity and tuning with
trim caps, all put in a cast aluminum box.

Both those idea's bigger than the old 3/4in sq can of old.

Trying to find treaded slugs could be a chore even it you wanted to

Trouble with the surplus stuff you don't know if it is 455 or 10.7

On class C tube PAs one could match a Pi-network by seeking the anode current minimum.

Is it at all possible to do the same on a switch-mode PA?

The rationale:
- want low power CW TX for ANY any HF band ever
- a carefully balanced push-pull PA output will be low in even harmonics
 (really low, I know from experience)
- I can use MOSFETs capable of taking huge excess I & V
- I'd rather avoid messing with many separate octave filters
- fiddling with many manual controls is OK w/ me

I am rather confident that the 5 poles in TWO separate hand-trimmed Pi-sections in series between step-up RF transformer and antenna will provide sufficient (mostly odd-) harmonic suppression. I'd first switch in a 50-ohm dummy load after the 1st Pi-section, match to it, then switch in the second Pi + antenna, tune up the 2nd Pi.

Before I start collecting parts for another TX and 2 Pi sections, I'd like to know if DC drain can be a useful indication for tuning up. I suspect, but don't know for a fact, that something in SMPAs may make the old way of tuning up impossible.

Any wisdom on that?

TIA + 73

I don't know the FT-757 but if it is the TX drive level you are changing, could it be that something in the TX section is oscillating? I once had that happen on my JST-100 and discovered a marginal design in the driver to the PA. It's was very long ago, I think I used an inductor somewhere and the problem was gone.

Nice video camera there.

There are over 400 meters in my rented storage.
I wish to now relinquish my proprietary rights to them.
For a small sum of money, someone else can become their master.
SO!............ for a mere $995, or best offer, plus shipping, off they
go.
The movements for each of these works.
Small side issue: I estimate they can be packed in about 12 to 15 cartons,
and their total weight will be about 280 pounds. I will agree to pay for
any
amount over 300 pounds. (Considering the
total amount paid, I might agree to deliver, but only after receiving
payment in full.)

The list is at:

Please be patient - its slow to appear.

Haven't seen any around for years.

Once upon a time -- back in the early 1970's -- I built two 2-mtr FM transceivers.

One was built from a kit sold by VHF Engineering, Rochester, NY. The receiver consisted of four small rectangular PC boards that could be assembled side-by-saide, one on top of the other, etc. Transmitter was a small rectangular PC board that ran about 2 watts output. As I recall, they also sold an amp with about 10 watts output. Crystal controlled.

The other was built from a circuit in QST. Several suppliers sold circuit boards and you had to dig around to find the parts. It was on a single PC board -- may have been about 4 in X 8 in. Crystal controlled.

But -- that was back in the days when men were men

I have used this device before a long time ago in projects designed by
other people without problems.

I am now trying to build a project myself & have struck a basic
problem.

The project is a home made Spectrum analyzer and I am trying to mix L.O
of 15Mhz (approx) with the output of a video I.F strip of 39Mhz as RF
feeding a xtal filter of 21.4Mhz.

My problem is with the L.O.

The specs for the SBL-1 states that I need +7dbm and the input of the device is 50 ohms.

I can generate enough 15Mhz approx 2v p/p (+10dbm) as measured on a scope.
I then knocked up a 3db 50 ohm pad and terminated it into a 50 ohm load and all worked approx 1.4v p/p across the load.(+7dbm)

Next step is to remove the load and connect to the SBL-1 (pin 8) via the pad and the levels drop considerably to about 0.75v p/p +1-+2dbm with a little distortion on the +ve peak.

This seems to indicate to me that the mixer input is not 50 ohm but a lot lower. I tried terminating all other ports with 50 ohms with no noticeable difference. What am I missing?

Why can't I see the correct level in to the device. I have plenty of drive before the pad but it reduces when connected to the SBL-1.

I am missing something. Can anyone prompt me?

You are on the right track: The SBL-1 LO port input impedance is not 50 ohms as you have correctly measured. On top of that, it is rather unlinear, i.e. drive level dependent.

Reason: LO drive has to turn mixer quad diodes in and out of conduction. The RF current needed for that depends on the instantaneous voltage/current point on the diode characteristic.

Conclusion: Important thing is that the three ports of the SBL-1 are terminated in 50 ohms, i.e. 'see' a low swr/return loss from the mixer's viewpoint. Your 3 dB pad adds nicely to that. You have done just the right thing.

Ease back and enjoy the result!

Thank you very much Sven for going to the trouble of answering my
query.

I will continue on with the next phase of the project with confidence.

Fitz Finds a Fact! - - Phase Coherence is the reason for the binding attractive force in ALL the 4 fundamental forces, Proof of this is in the following:

Our space is built up by the average amount elements are out of phase with each other.

Repulsive forces are generated between elements that are out of phase more than this average.

While elements more in phase, than this average (phase coherence), produce attractive forces.

Hey OT:

That dream is just a throw back from the ole magazine days when they
always put in errors then 3 months later you gets the correction. Plus
a 74hc4046 can only run up to 7volts Vcc

So the correction would be running a 74hc4066 as a pll. One switch as
the VCO and a couple diode for the comparator. and another switch as
for the xtal OSC and another switch for a low pass filter.

Or if you do use a 74hc4046 you just upconvert and downconvert
everything and run it at 6 volts. Cause about 10Mhz is all you can
gets out of a 74hc40466 at 6 volts

My point exactly.  I drive a lot with my job and I used to call "N0EDV
monitoring" on every repeater I travel by.  Not a single response in

Similar situation here in the north of Scotland . Usually there is some
traffic after 1800 hrs when people return home ,but during the day
veeery little response. One reason is obviously low population numbers
in this part of the world.

Has it been different in your country?

Over here there has been a very high peak of 2m usage in the late seventies, early eighties of the last century. In those days, there was a clear demand for a legal radio communication hobby. CB was illegal here, and around 1976 there a novice license was introduced that allowed use of 6 frequencies in the 2 meter band. Later that was extended to all of 145-145.8 MHz and the license, which used to be only for 2 years, was made permanent.
At the same time, the "technicians license" (no morse code) which allowed use of all bands above 144 MHz became very popular.
Hundreds of new licenses were isssued every exam round.

In those days, 2 meters was really crowded here. It could take quite some time to find a clear channel, especially in the novice subband.

Later, around 1985, packet radio became very popular and the frequencies assigned to it became very crowded (even though the novice licensees were not allowed to use it).

All this time dx-ing in CW and SSB in the lower part of the band was also quite popular, one could tune to 144.050 or 144.300 every day and hear activity. In contests the whole SSB band was piled up with stations.

Of course from the ninetees it has been decaying, and today there are only a few frequencies where local groups are QRV and sometimes talking a little. The repeaters are mostly silent, and a random traveller calling

will probably get not much response either.
(what is left on the bands usually talks to eachother in their local
group only; random QSO with a stranger is not happening much anymore)

When I became a ham in 1978 I built my own 2m transceiver... it was
loosely based on a design by PA0KSB that appeared in Electron, the
club newsletter.

All,

Thinking of practical ways to alleviate my boredom, I'm wondering if I
can convert my junk box to cash?

If I build quality QRP gear and advertise it on etsy or ebay as
handbuilt gear, will people buy it?

With some of the stuff I see sold on eBay, I think a guy could sell fake rubber dog shit from Hong Kong! So, if it's not horribly expensive or time-consuming to build, give one a try :) Worst case, you'd have a new QRP rig in the shack :) Of course, that's just my opinion ;)

Good Day all!
I have recently got one of these sets and am rapidly upgrading the original design.
So far it has a Kokusai Mech filter, manual and AGC Rf gain control on the RF stage. It has also had improvements to its AGC system and I am about to update the RF stage FET.
One problem has arisen and someone might be able to help me here.
The Kokusai filter is NOT actually on 455 kHz, it's actual centre frequency is 454.2 kHz (measured against a calibrated frequency counter), Since the self excited BFO is NOT drift free I want to replace it with USB/LSB Xtals.
Can you still get the old time FT241 types, or does anyone know a source of odd frequencies in the 455/465 kHz IF range?
I calculate that the the old FT241 channels I would need would be 328 and 326. That would give me BFO frequencies of 455.55 (should be 455.7) and 452.7 kHz that fits in with the odd filter.
That way one of the main sources of drift should be almost gone.
I have found that the FRG-7 has its problems, but, as someone who has designed and built many communication receivers over the years IMO it is the basis for quite a useful general coverage receiver and a VERY useful bit of test gear with noise bridges etc.
Any suggestions gratefully received.
73's Cliff Wright ZL1BDA ex G3NIA New Zealand.

I guess it depends on where you are. In my neighborhood, most of the repeaters are pretty busy.

What I have found is that if you want traffic, generate some traffic. Get on and talk with someone. You'll find that there will be more traffic. We get travelers, and there's someone on most of the time, although I wouldn't expect much traffic in the wee AM hours.

Another way of looking at it is that a commercial receiver makes a good start at a semi-homebrew project.

I remember one article in QST in the late fifties where someone bought a Knight Kit receiver and never built it as instructed. He used the chassis and such and the variable capacitors and tuned circuits but built up a different receiver. He saved on not having to do the chassis work.

There were lots of receivers built that way around surplus equipment.

People rebuilt older receivers, pretty much starting from scratch, either to put in miniature tubes or solid state the receiver. They even admitted that at that point they might as well have started from scratch, but the mechanical work in the receiver provided an advantage.

I was agonizing earlier in the year about buying a Grundig 4000 when they were selling for under a hundred dollars (made more tempting by having a gift card for the store, and at least at one point they were tossing in a windup radio). In the end, I decided it was too frivolous. But, I was tempted precisely to use it as a project radio. As a portable, any portable for that matter, there are some disadvantages, and merely putting it in a bigger case and rearranging the controls, and adding a tuning knob (it only has up/down switches) would make a fairly great operational improvement. Add another switch so the IF bandwidth switch doesn't control whether FM reception is mono or stereo. Add a preselector for improved front end selectivity. Add an analog s-meter. Add an RF gain control, or at least multiple levels of attenuation in the front end. Move the BFO tuning to something that is easier to use (it's a thumbwheel). Get a ceramic resonator and add a CW bandwidth selectivity. Get some ceramic filters and improve selectivity. Maybe add a synchronous detector. Once it's in a bigger box, it's so much easier to add modifications.

I thought of it as a fun project, get a leap start on building a full range shortwave receiver, but make it more functional and easier to use. Even at a hundred dollars, it's almost at the range where people would consider it throwaway, when it dipped under a hundred dollars it was even moreso.

The problem was, I already have one, bought at the $100 level last fall, plus a couple of better Grundigs that I bought at rummage sales for a lot less. Out of the box those older Grundigs have more features, and if I realistically, one of them would be a better choice for this sort of work.

So in the end, I didn't pursue the project, because as fun as it would have been, the end product wasn't necessary to my needs.

I always start from scratch. I build my own PCB's, wind my own coils, metal enclosures and chassis. If I was capable of making all my own components, including tubes, I would sure would give it a go - real homebrew!

  A FRG-7 from scratch would make a good project for you!

War story...many moons ago I saw a brand new FT-757 at a hamfest
disassembled to the fullest extent possible.  They had just hit the
market at the time.  The story was that it was an evaluation rig and the
teardown was part of the evaluation.  They only wanted $100 for the
pieces and I was tempted to grab it.  A 757 Kit - haha.

Then common sense clicked in.  What if it is missing a couple of crucial
pieces?

SEE this one: General relativity is simply explained by Fitzpatrick's RPR - - (Relative Phase Relationships).

Our space is built up by the average amount elements are out of phase with each other.

Repulsive forces are generated between elements that are out of phase more than this average.

While elements more in phase, than this average (phase coherence), produce attractive forces.

I could quite possibly design and build a far better receiver than the FRG-7
anyhow!
Manufacturers build to a design price - so inevitably compromises have to be
made to keep within budget.
As a lone constructor, that restriction doesn't even enter into the equation
when I design and build. The only problem I sometimes find is when certain
components become obsolete and consequentially unavailable, so then it

becomes a case of "back to the drawing board!"

When I was in college (many moons ago), one of my HAM classmates
disassembled Collins transceivers to get parts for his hombrewing!
And when he was finished, they even looked nice (X-Y wiring, etc.)

Me?  I take old TV's apart.

They will, although quite possibly not at a price that it would make it worth
your while.  You'd pretty much have to try it out to know for certain, though!

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |

 rec.radio.amateur.boatanchors |
 rec.radio.amateur.dx |
 rec.radio.amateur.equipment |
 rec.radio.amateur.homebrew |
 rec.radio.amateur.moderated |
 rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

Mathematician Steven Wolfram said, "Math can only explain simple things. You need a MODEL to explain complicated things, but a simple MODEL can explain a complicated universe."   So include quotes and type "phase coherence" into Google.

Then you will find my "phase coherence" MODEL   It's at many places in Google.

It was at the #1 TOP spot, in Google, from Sept./22/2010 . . .
to . . . Oct./04/2010 (Fitz Finds a fact! - - Phase Coherence is the reason...)

Why did it take top spot in Google?

It's a MODEL Einstein tried to find but never did.

To see it click link:

Another site they used 2, 1mh coils in close proximity and tuning with

Both those idea's bigger than the old 3/4in sq can of old.

Trying to find treaded slugs could be a chore even it you wanted to
dup the old cans,

Trouble with the surplus stuff you don't know if it is 455 or 10.7
unless you test it or take it apart.

Many years ago I designed and built a 9 MHz IF amplifier using FETs
and home-made coils using toroidal cores.

You can buy 10.7 IF cans from Dan's Small Parts web site at http://www.danssmallpartsandkits.net/. They're listed about 1/5 of the way down the page. Be patient when you scroll... it's a big page and he doesn't have a search utility on the site. Cheap enough at $1.65 each.
They're built specifically for solid state receivers, so they might not have the right turns ratio for tube circuits. You could buy a couple and experiment.

An alternative source for 10.7 Mhz IF transformers would be in a scrapped FM radio. You might find a suitable donor quite cheaply at a flea market, garage sale, etc.

I had a bitof bad news from my ISP last Christmas. They were not happy with SEK 140 per year. So they closed down my homepages and offered me the Telia WebHotel at SEK 3600 per year.

I am hosting the homepages myself, but i have now got my own domain, so I can move the pages anywhere I want.

The URL is now www.sm0vpo.com/

There is a standby on my other computer at www.sm0vpo.com:800/

So if you wonder where my homepages went, there is the answer. They have been online all the time, but without Usernet access I could not tell anyone.

Port 800 doesn't work for me ... tried 8000, just in case a mistake was
made, doesn't work either ... the other, on default 80 is kewl.

Hey OT:

Dans small parts is a gr8 site. the reason he calls it small parts
because he got not many parts for tubes, those IF cans won't hold up
to the voltage that is on the plates of tubes, unless you might be
able to use 12volt plate voltage tubes that Tung Sol came out with
back in the day just as transistors were taking over. I remember in
1960 I had a Buick Special car, the radio that used 12 volt plate
voltage tubes and a transistor AF output.

I seen sum web site that used a 12AX7 at 12 volt plate voltage, maybe
if you used a 12AX7 in cascode you could get enough gain at 12volts
plate voltage.

The best bet I've seen is a toroid with trim caps for tuning. Way back
in the day b4 they used treaded ferrite slugs they used trim caps to
tune the IF cans.

Ray-

Even with the misspelling, a Google search appears to have found a manual at the BAMA mirror. Does the manual not have a diagram?

There may also be information at radiomuseum.org.

It works now.

I just upgraded the router to stop the occasional hangups.

There will be a short outage sometime next week when I put 200A/H batteries and connect solar panels to the SPU.

If you ever have such problems again with a host try 1and1. I use them for my web site and AFAICT it was never down in all those years. Cost went up a bit lately but not 20-fold. It costs me around $80/year, with domain registration, email, FTP and all that.

Joerg

I've used SDF (Super Dimension Fortress) in the USA for several years, and there is also a European version < http://sdf-eu.org/ >. It has several levels of membership depending on how much storage space you want. I pay $36/year for a gigabyte. It's UNIX (Linux?) based.

FWIW, my website is < http://mcalhoun.sdf.org >.

This balun will only handle 1500 watts PEP. Do not try running RTTY or
other full-carrier mode through it at 1500 watts.

Trust me on that. :-)

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Looking for about 20 Teflon type coax jumpers (RG-142 size coax or similar). Need N-Female chassis mount on one end. Remaining end can be any connector as I cut them off and solder direct to circuit board. Jumpers need to be about 16" long or so. Emailed Hangar 18 surplus with no reply.

huh?

The half turn and the other turns were ok? This is impossible!?!?! One has the same current through the whole coil and if the wire was uniform then it should heat heally well. Not only that copper is a good heat conductor so if the 1/2 turn was heating up then he heat should spread pretty quickly.

This assumes everything else is uniform along the coil. Something has to be going on that your not telling us? Ideally the heat should be uniformly distributed along the coil.

By "HOT" I assume you mean much much hotter than the other coils?

Heat is generated by the current, is it not? and the current should be uniform throughout the wire? The resistance of the wire itself should also be uniform. This suggests that the heat dissipated per unit length is independent of position.

Were both ends hot? If not then something else is going on. Because you are saying the .5 end of a 4.5 coil got HOT. Yet which end? the 4.5 coil has two .5 ends and should in theory be symmetric and hence both get equally HOT. If they wern't then something is aloof.

I think it's forcing a substantial portion of the flux to pass through half of the core and thus increasing the core losses.

There's a half turn technique used in transformer design that ends up with two half turns in parallel IIRC. Maybe you could use that.

Not impossible, there's more than one heating mechanism, not that I can
explain them,
but I know there can be heating in the fringe field of the gap.

 Hot enough to burn the insulators used.

 LOLROTF, ya both ends would be a 1/2 turn??? I'm speechless
and don't know what to say. :-) Don't confuse me with such things!

Bring wires out opposite slots on a pot core. I've seen it do strange stuff, too.

Half a circle, as used at say 450 MHz and up (the one end is soldered to
one point on a circuit board, goes straight up say 1/4", bends over 180
degrees and the other end soldered to another pad on the PC board...just
like this "U" but flipped over (upsidedown U)...

This kind of odd-ball result can be caused by "parasitics" - in other words, a high overtone excited by just the right length of inductor paired with just the right stray capacitance, and energized by something that can hit the high notes....

  I got some confirmation from my collaborator, The 1/2 turn as were
describing it
was the LAST 1/2 turn wound on the bobbin.

Maybe, but we had it confirmed by someone else and I doubt very much

they developed the circuit we were using to do the test. We used it to
cancel
out the capacitance of a piezo transducer. Driving about 250 watts into a
20 ohm load, at about 600 khz.

It doesn't happen to be nicked, forming a shorted turn perhaps?

What you describing is,

```
     L1   V  L2
V1--/\/\--+--/--0
```

on the same core?

L2, the 1/2 turn part of the coil is behaving wildly different than expect?

After all, ideally L2 has resistance in direct proportion to the total winding which in this case 0.5*/4.5 ~ 11% of the total resistance of the coil.

In a single coil the power dissipation of the 1/2 turn would also be ~ 11% and this is quite easy to see. You are saying that it is much more than this as if the ratio's were turned up side down. Something like the 1/2 part dissipating 90% and the 4 turns part dissipating 10%?

if you agree with the layout of

```
     L1   V  L2
V1--/\/\--+--/--0
```

Then it is easy to see that in ideal circumstances the current through L1 should equal that of L2 and the I^2R heating would produce the results I described first.

Instead of assuming the two inductors are on the same core we can assume they are on different cores. This will help us understand if differences in flux could cause such problems.

You mentioned in another post that you were using AC to drive the coil? Did the effect happen with DC?

Did you measure the voltage on the 1/2 turn?

Was the core itself generating the heat or was it due to the 1/2 turn?

What was the total current through the coil?

Was it possible the coil could have been shorting out on another turn or the core?

Was it really 1/2 a turn getting hot or "just the end of it"?

Was the coil tested by itself outside the circuit? If so did it exhibit the same phenomena?

What was the end of the coil that generated the heat connected to? Was the connection itself possible cause for the heat?

Was the coil reversed in the circuit? If so did it exhibit the same problem with the ends switched?

You mentioned that you tried 4 turns and 5 turns and the problem went away. Did it go away completely or partially? Was those two coils made exactly the same way and connected the same or were they in any way different besides just the turn difference?

Was the coil one continuous piece? the 1/2 turn was not spliced on?

Did you try a 5.5 and/or 6 turn coil?

Did the 1/2 turn end get hot very quick or did it take a while? Basically seconds or minutes?

Did you try to change the direction of the core relative to the coil? If so did it make any difference?

Is there any possible way the core itself could have been generating the heat at the 1/2 turn and the effect you experienced was just the core heating up that 1/2 first?

Did you allow the inductor to run a long time? If so, What was the effect still? Was the whole coil hot or still just the 1/2 turn?

Hopefully you can answer some of these questions. It sounds to me like you didn't do much troubleshooting so I expect most of them can't be answered so the true reason probably will not be known.

The whole think would have got hot, we were pushing limits.

Probably, won't know the answer, once we learned the 1/2 turn overheated we didn't do it again.
But it stuck as a curiosity. I had one of the overheated 4-1/2 turn bobbins

hanging on a cord over my
bench for years. It's been ten years but my old bench is still the same,
next time I stop in I'll see if it
the bobbins is still hanging.

You don't have to guess whether I am right or wrong: you just have to
hang a 200MHz bandwidth scope on the hot end, and see what you get.

There isn't a cold solder joint at the heating end of the coil?  This
would result in localized heating to one end of the coil ... strange is
all I can say.

Never mind, the confirmation you mention, done by another, was obviously done on another coil ... duh, should have read all the posts before commenting ...

It may have something to do with the magnetic path handling the half
turn. The core may be saturating sooner.

I don't know what to say. Just not enough information. If your looking from some exotic possibility I don't think you'll find one.

The reason is that the current through the wire will almost be surely the same through out all points along the wire. That precisely means that the heat generated per unit length will be the same. Even if you have some crazy resonance or core flux/transformer effect going on, that current in the wire has to be the same through the whole wire(assuming no shorts).

You can't have electrons bunch up on part of the wire and not on any other part. Even if you could, that bunch would have to flow through the wire from one part to another and on average it would heat it up uniformly.

The reason is simple, We all know that for a power supply when one electron is supplied on the wire one electron leaves it so there really is no way to "bunch" it up.

Now, if the wire is not uniform in size or resistance then the heating effect is not uniform. As smith mentioned about the joint connecting the coil. In this case it is possible that the joint could be heating up and it was being passed along to the 1/2 turn and it just happens that you didn't let it run long enough to heat up any more turns.

The 1/2 turn was really a point at the joint and the heat just spread about about 1/2 turn.

To me this is the most plausable case. I'm not sure if it's physically possible any other way that involves the coil itself generating generating the heat. (I gave a good reason about about electron flow being uniform in the wire)

It may be possible using some type of standing wave or transformer like effect but even here I can't see it possible if the wire's restance per unit length is constant.

Well, no:
http://en.wikipedia.org/wiki/Proximity_effect_%28electromagnetism%29

the current density varies strongly, especially if the wire is thick (curiously, it was never stated what size wire is in question, nor what type; 600kHz suggests fine stranded litz!).

Wire near the gap (which is usually placed in the center, right underneath the winding) experiences fringing fields, which dramatically increases losses.

> That precisely means that the heat generated per unit length will be the
> same.

Eddy currents in the center of the coil are much stronger than at the ends, so the center of a solenoid heats up much more strongly.

The uncooled coil in this video demonstrates proximity effect:
http://www.youtube.com/watch?v=nY66rBJvbpY
See the connections are clean and coppery, but the coil has seen better days. You can't really tell if the center turns are hotter; they probably are by a little bit.

Of course Kirchoff is harder to fool, obviously the total current flowing along the wire is the current flowing along the wire period. Unless there's a short, which supposedly was inspected as to have none.

None of these are an "end" effect. The only possible explanation is a short, or else, "look harder". It's plainly obvious that the cause is NOT "an additional half turn". It is only a coincidence that this symptom showed up between turns 4 and 5.

Hey OM:

First how many newsgroups do you have this thread cross posted on?

Second: A 1/2 turn is equal to 1 turn in a pot core so 4 and 1/2 turns
is the same as 5 turns.

Lastly OM: I think you are looking at a classic case of proximity
effect.

I'm sure it was not a bad connection.
I know all about heat caused by I^2 x R at connections.
In fact just yesterday I was checking for bad connections on my electric
gokart and I burned my finger! I found a loose connection between a
5/16" post and a ring terminal connected to a 6 gauge wire.
It was some oddity about the 1/2 turn in a potcore. I suspect the low
turns count is also important to the phenomena.
I thought I'd ask and see if anybody else ever had the problem.
Closest I got was when John Larkin said,
"I've seen it do strange stuff, too."
John, would you care to elaborate?

Again it has been 10 years, but I think the coil in question had something
like 4-24 gauge wires in parallel, maybe 28 gauge.

Yes, we learned to space our wire away from the gap, after finding burned
wire and melted bobbins in the center where the gap was.

One of my engineers, a real magnetics guy who used to work for Signal
Transformer, designed a push-pull forward dc/dc converter using a pot
core. This was in the power supply of a laser controller [1] where the
customer, for reasons never rationalized, wanted our +24 power to be
isolated. One center-tapped winding included a half turn on each side,
and efficiency was terrible. Going to full turns, and wasting a bit
more power in a downstream linear regulator, worked much better.

Neither of us understood why.

John

[1] The controller is still in production. It manages the firing of a series of deep-UV MOPA lasers that expose some fraction of the fine-pitch ICs made in the world.

I don't think so. If I put 4-1/2 turns on a potcore and measure inductance,
then unwind the 1/2 turn, do you think the inductance will measure the same?

It may be, but I can't explain to myself how that would happen. I do think
it has
something to do with the flux through the coil though.

Hmmm...it is easy to demonstrate two coils in series, loaded with two caps to provide two (different Fx) resonant paths - the coil in the part that resonates carries way more current than the path that is not resonating...

Well that's obvious, it's acting like two transformers. Huge LL between halves. Imagine the full path of each turn, it's effectively a full turn around one outer limb or the other, but not both.

Whether or not you curve it tightly around the center limb doesn't matter, intensions are lost on inanimate objects. :)

Hey OM:

I am looking for the same thing but with 1 volt tubes I'd like to duplicate the old Zenith trans oceanic radio. Now there was a radio that is proven.
Not a single solid state device if I recall, great if there is ever a EMP that takes out all the solid state radios.
For some reason there are plenty of 1 volt tubes out there even though they haven't been made for sum 40 years.

But I digress. Get a Howard Sams TR manual, there will get you the schematic. The real old radio's were hard wired no PCB. I know you can find a schematic that is all transistors, bipolar though, no FETS in those days, and I know they are still making germanium transistors which are great for front ends.

And I think these is exactly why you are pursing it. You believe it must be due to some fanciful effect because of the "1/2" turn as if 0.5 was more special than 0.73524 or 1.0.

You have the mindset to those people that think 3.141592... is special. This causes you to overlook the obvious. First, pi in another base is not 3.1415.... but in any case it must have been some number. In some alternate universe we could imagine it being 5.43524. In is only special in the sense that we make it special because it seems different than most other decimals. In fact though there are a ton of "special numbers".

The theory of ideal inductors does not give any reason why a 1/2 turn should at all be important. Tim mentioned the promixity effect which would produce heating throughout the windings and more so for inner windings so it is not the correct effect here.

Most other phenomena that stand any chance of creating the effect would do it symmetrical. Why? Because both ends have no special preference for the heat. This should be completely obvious.

The only chance is if you wrapped the windings in such a strange and crazy way and a totally screwed up core as to make a retard jealous of your work.

We think of other possibilities that would work in a non-symmetric way but they just don't seem to gel with physics. No one can say for sure since you obviously don't have any good investigative information to provide about it.

Almost always things that seem phenomenal are due to simple mistakes. If you are really serious about it then I would suggest you attempt to reproduce the result then do a bit more investigation. Until then you might want to drop it because we don't need another cold fusion story circulating around. (I'm being facetious)

Heptodes like 1R5 or DK91 were used in battery powered superhets, so
googling for these might bring up something interesting.

Oh, yes, it DOES give a reason.  A pot core (or E cores) has a pair of
return
flux arms flanking the central element, and a '1/2 turn' winding
imbalances
those return fluxes.

That means the 3-d flux inside the core is very different in the
two cases, and if one return arm saturates, that flux distribution
alters
considerably during the cycle.  That causes (1) the material to heat
due to remagnetization in an asymmetric way, (2) the forces of the
pole pieces to modulate as the field builds.  The first effect (caused
by material hysteresis) might have been expected.  The second
effect, though, will cause ultrasonic excitation of the core, maybe
creating cracks by mechanical stress.

In the ideal case the fringe effects are usually ignored. Atleast every book
I've read about inductance supposes the fringe effects can be ignored.

Remember, we are talking about the inductive effects on heating those ends and not the inductance itself.

In all causes if the the ends are relatively symmetric then both should heat up equally. Also the fringe effects tend to reduce the heat on the ends and not increase it. Also all the effects you describe should heat the central windings more than the outside and have little to do with the end turn amount. Again, In all cases it would be symmetric unless the core or windings themselfs were wound in some weird way. 99.99999% of all inductors are wound to be symmetric.

So if there is some effect that is due to the reasons you describe then it must be because they let a 2 year old create the winding.

Now, you'll have to excuse me if I make some assumptions about what is going on. When he says inductor I think of basically something that looks like an inductor and acts like one. So if he did something non-standard then he should include that information.

I cannot totally exclude some physical reason why such a thing could happen because I don't know all the possibities. Given the assumption that what they created was very much inductor like no one has presented any reason why only one side would heat up and the rest of the coil would be fine that is due to the coil/core.

The most likely effect is that the connection on that one end was bad or was shorting out. This is the best guess given the little amount of information that was provided.

Since he said the same result was produced independently then this possibly suggests something else but the same mistake could have been made twice.

It would be quite easy to create a partially laminated core that was not laminated near one end. The core would heat up due to eddy currents which would heat up the 1/2 turn first. Who the hell would use such a core? Such behavior is to be expected when someone doesn't know what they are doing.

   What 'fringe effects'?   This is about the flux contained in the
   magnetic arms of the core, not outside somewhere

Oh, this has nothing to do with ohmic heating in the windings. It
concerns
the B-H curve, which (for a hysteretic material) loops around some
area.
At 600 kHz, the area, multiplied by 6e6, is the power lost when the
magnetic material is forced to traverse that loop.
If part of the material saturates, its loop is of greater area than
the rest of
the material.   A core that should handle 2A without overheating, then
would overheat.

Some may find interest in this.
A turn around an outside leg of an E-core is called a half-turn because it encloses only one-half of the cross-sectional area of a turn around the center leg. It is well known that a half-turn in a secondary winding of a power transformer greatly increases the leakage inductance between windings, thus causing an adverse effect on cross-regulation. However, the increased leakage inductance of a half-turn can be very beneficial in tapped inductors for boost circuits and in coupled output chokes. This paper explains some of

these little-known applications of a half-turn. The theory and formulae for prediction of leakage inductance added by such a half-turn are presented

They are around, I sold a number of those battery radio valves recently.
The other thing to look out for are the miniature valves that were used
in deaf aids.

The reason we have Gravity?

A correct theory of gravity will show us these four (4) things:

1. It will show us why gravity also acts like acceleration (principle of equvalence).
2. It will show us the actual cause of gravity.
3. It will show us why gravitational mass and inertial mass are identical.
4. It will show us the speed of gravitational attraction.

Newton said gravity was acting at a much faster speed than Einstein.
Which one of them was right?

Only two ideas from me, and they seem weak.

A half turn means the current goes in and out on separate sides. That makes one turn of inductance perpendicular to the rest of the turns that would skew the magnetic field.

If it is a powdered iron core, the volts per turn could be high enough that it conducts electricity.

You may be on to something. Maybe. At least it make physics sense to
me, but then i are enguneer. It does show a path to have thermal
non-uniformity that is regenreative.

Say Mike just how big is that pot core?
